- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen

- Agert, Carsten (Prüfungsberechtigt)
- Günther, Andreas (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Jimenez Martinez, Cuauhtemoc Adrian (Prüfungsberechtigt)
- Knecht, Robin (Prüfungsberechtigt)
- Torio, Herena (Prüfungsberechtigt)
- Malz, Simone (Prüfungsberechtigt)
- Ziethe, Paul (Prüfungsberechtigt)

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- identify their competence and incompetence with respect to the study of renewable energies
- describe basic knowledge from a wide field of disciplines as required for renewable energies
- perform laboratory measurements in a university environment according to scientific standards
- analyse and interpret measurement results using relevant and widely used software tools
- work and communicate their results with international and interdisciplinary partners
- critically discuss basic principles of current mainstream economics
- distinguish between the classical, neo-classical and selected heterodox economics and relate those approaches to the historic economic development
- distinguish and evaluate the peculiarities of selected energy markets and its regulatory frameworks

Module contents

The module is designed to give students a solid foundation to successfully start the MSc programme. The content from the field of Physics, Mathematics as well as Electrical and Mechanical Engineering aims to provide a homogenous foundation for the study of renewable energies via lectures and laboratory experiments. With an introduction into Socio-economics students will learn about the principles of mainstream economics, the peculiarities of energy markets and will get insight into some selected heterodox economic perspectives.

Primers (Lecture & Exercises ? 60 h workload)

- Mathematics
- Programming
- Modelling
- Electronic Power Systems
- Semiconductor Physics
- Material Characterization
- Thermodynamics
- Fluid Dynamics

Laboratories (Theoretical/practical Seminar ? 120 h workload)
- Introductory Laboratory
- Interaction Light and Matter
- Heat Transfer
- Fluid Dynamics
- Storage Technologies

Introduction to Socio-economics (Lecture & Seminar ? 90 h workload)
- Scarcity, market
- Supply and demand
- Equilibrium
- Elasticity
- Incentives, free market, role of the state
- Peculiarities of energy markets and corresponding regulatory frameworks
- Limitations of mainstream economics
- Selected heterodox economics

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- characterise the global energy system and analyse the structure and constraints of today’s energy system
- explain the availability and connection between solar and wind energy
- identify the problems and challenges of energy supply due to fluctuating energy resources with varying and seasonal load profiles
- relate the solar irradiance conversion process as well as the atmospheric radiation balance of the earth to Wind Energy Meteorology

Module contents

This module will give an overview on the global energy system and the challenges of energy supply due to fluctuating energy resources with varying and seasonal load profiles.

Energy Meteorology (Lecture ? 90 h workload)

Section I: Solar Irradiance

- Radiation Laws
- Solar Geometry
- Interaction of solar irradiance with the atmosphere
- Radiation Climatology
- Solar Radiation Model
- Statistical Properties of Solar Irradiance
- Measuring devices to ascertain Solar Radiation balance
- Satellite-supported data acquisition to assess Solar Irradiance

Section II: Wind Flow

- Origin and Potential of atmospheric energy movements, Heat balance of the atmosphere
- Physical laws of atmospheric flow
- Wind circulation in the atmosphere, Local Winds
- Wind flow in atmospheric layers (Vertical Structure, Ekman Layer)
- Assessment of Wind potential (European Wind Atlas: Model, Concept
- Wind Measurements

Energy Systems (Lecture ? 90 h workload)

- Definitions, separation electrical - thermal energy use
- Resources & reserves
- Energy system analysis: Efficiencies at various levels of the energy chain; Exergy analysis
- Energy scenarios
- Climate Change
- Advanced (power plant) technologies for conventional fuels
- Electric power systems with large shares of renewables

- Wark, Michael (Prüfungsberechtigt)
- Pehiken, Alexandra (Prüfungsberechtigt)
- Steinberger-Wilckens, Robert (Prüfungsberechtigt)

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- critically evaluate and compare three major Renewable Energy conversion processes and technologies: photovoltaics, wind energy and one out of three of solar thermal energy, biomass energy or hydro power.
- critically appraise various electrochemical storage processes and the respective storage techniques
- analyse various system components and their interconnections within a complex Renewable Energy supply system.
- evaluate the Renewable Energy supply systems' operational size and efficiency.
- critically evaluate non-technical impact and side effects when implementing renewable energy supply systems

Module contents

This module will give an overview over a selection of the major renewable energy technologies and some possibilities of their storage. The focus is on the scientific principles of components and the technical description of the components. Further detailed system analysis will be presented in other modules.

Photovoltaics (Lecture ? 90 h workload)

Physics of PV:

- Basic and most important properties of solar radiation related to photovoltaics
- PV cells basics: Fundamental physical processes in photovoltaic materials
- Characterisation and basic modelling of solar cells

Component Description:

- PV generator
- Charge controller
- Inverter
- Balance of system components

System Description

- Grid Connected System
- Stand Alone System

Basics of Wind Energy (Lecture ? 90 h workload)

- Wind characterization and anemometers
- Aerodynamic aspects of wind energy conversion
- Wind turbine performance
- Design of wind turbines
- Dimensional analysis and pi-theorem

Fuel Cells & Energy Storage (Lecture ? 90 h workload)

- Fundamentals of electrochemistry and thermodynamics, energy and environmental balances
- Basics of hydrogen production - starting materials, processes, efficiencies, environmental impacts
- Basics of fuel cells function, materials, construction, systems, applications
- Fundamental setup of most common battery types
- Fundamental chemical reactions in these batteries
- Operational characteristics, weir processes and service lives of these batteries.

Solar Thermal Energy, Biomass Energy, Hydro Power

Students select one out of the three units:

a. Solar Thermal Energy (90 h workload)
b. Biomass Energy (90 h workload)
c. Hydro Power (90 h workload)

In the third semester the other two of the three units will be selected in the module Renewable Energy Technology II.

Solar Thermal Energy  (Seminar & Exercises ? 90 h workload)

- Assessment of solar thermal ambient parameters: regional global, diffuse, reflected solar radiation on horizontal and on tilted plane, ambient temperature
- Solar thermal collectors
- Solar thermal heat exchangers
- Solar thermal storages
- Solar thermal systems and their operation
- Characterization of solar thermal systems

Biomass Energy (Lecture ? 90 h workload)

- Energy mix overview; gas, heat, electricity, Pros & Cons of biomass
- Chemical composition of biomass: sugar, cellulose, starch, fats, Oils, proteins, lignin
- Natural photosynthesis in plants: chemical storage of solar energy; general mechanisms
- Chemistry & Biology (microorganism) of Biogas Technology
- Conversion processes of biomass: classification, main pathways
- Introduction to catalysis used in biomass conversion
- Chemical fuels (chemical energy storage) from biomass, routes to platform chemicals and separation processes
- Technology concepts for bioenergy usage
- Introduction into economical and legal constraints

Hydro Power (Seminar & Exercises ? 90 h workload)

- Theoretical background: general hydraulic terms, Bernoulli Equation, Major Empirical Formulae and their backgrounds
- Water Resource: catchment area, seasonal precipitation, flow duration curve, dam, & run off river
- Powerhouse: penstock, water hammer, cavitation, tailrace
- Turbines: main types of turbines, their characteristics & their components
- Ocean Power Overview

## Module contents

The module “Sustainability of RE Systems” provides the theoretical background for understanding main concepts and interdisciplinary scientific methods from the context as well as their role in the sustainability debate.

*Sustainability Seminar (Lecture & Seminar ? 180 h workload)*

- Strategies and dimensions in sustainability research and discussion: efficiency, consistency and sufficiency, as well as related concepts (e.g. rebound)
- Growth/De-growth and decoupling of growth and emission
- Life-cycle analysis
- Thermodynamic methods: exergy, EROI and related approaches
- Social indicators and their relation to energy use
- Economic indicators and related paradigms in the context of energy consumption
- Resilience and its operationalisation for energy systems
- Methods for developing and assess socio-technical scenarios

pre051 - Renewable Energy Systems Laboratory and Modelling

Module label: Renewable Energy Systems Laboratory and Modelling
Modulkürzel: pre051
Credit points: 6.0 KP
Workload: 180 h
Verwendbarkeit des Moduls: Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen
- Günther, Andreas (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Jimenez Martinez, Cuauhtemoc Adrian (Prüfungsberechtigt)
- Torio, Herena (Prüfungsberechtigt)
- Knipper, Martin (Prüfungsberechtigt)
- Peinke, Joachim (Module responsibility)
- Knipper, Martin (Module responsibility)

Prerequisites
Skills to be acquired in this module

- implement as well as critically analyse and discuss models and their limitations using various methods
- develop research questions and approaches to answer them
- perform laboratory measurements or simulations in a university environment
- analyse and interpret their results using relevant and widely used software tools
- work and communicate their results with international and interdisciplinary partners according to scientific standards

Module contents

In this module the students obtain the knowledge and skills on programming, modelling and critically analysing simulations and apply those in a topic on renewable energies of their choice. Students have the choice to simulate specific renewable energy components or systems which are later investigated in hands-on laboratories. Through this students learn to critically discuss the results of their simulations and compare them to real measurements as well the results from differently implemented simulations from which they deduce the limits and validity of the respective models.

Modelling and Simulation of Renewable Energy Systems (Lecture & Seminar ? 90 h workload)

- numerical concepts
- differential equations
- discrete models
- statistical modeling
- algorithms to develop simulations
- building a simple model from the field of renewable energies
- various tools to implement and critically analyse the performance and limits of a model
- examples of various simulation approaches
Laboratory on Renewable Energy Systems (Theoretical/practical Seminar ? 90 h workload)

- Theory, Hands-on experience and reporting on either:
  - Improved Cook Stoves
  - Wind Energy Systems
  - Solar Home Systems
  - Meteorological Resource Assessment
- Student conference on the Performance of Renewable Energy Systems

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- evaluate and critically reflect on his/her two months working experience
- critically appraise and compare professional working in different working environments, i.e. business, research, development organisation
- conclude whether he/she intends to work further in this particular field of Renewable Energy for his/her master thesis
- present data and information both verbally and in the written form to a professional standard (i.e. scientific report writing, presentation and quotation)

Module contents

External Internship (180 h workload)

The ‘External Internship’ is an approximately two-month stay in companies, consultancies, international development organisations or research institutes, normally outside Oldenburg University. Students stay for and perform ? in accordance with some basic principles ? one or several tasks, related to the activities/business of the respective host organisation. The training, normally situated in the break between the first and second semester of the postgraduate programme, can either help to prepare for the six-month Master Thesis Project, which will follow after the third term. Otherwise, it can also be used as a supplementary or complementary experience in an additional field of interest. Organisations that take PPRE students for an internship may have their own regulations with respect to internships, which apply anyway. The external Internship will be concluded by a report (ca. 20 pages).

The University of Oldenburg requests to fulfil a few requirements for the internship:

- The university needs an acceptance letter (incl. contact details of local supervisor and topic of internship) from the host organisation prior to start the internship.
- The duration of the training should enable students to return to university at the beginning of summer term classes.
- Weekly full-time workload is required. However, it should not exceed local standards.
- Students are asked to hand in a report (approx. 20 pages) on their training, comprising a description of the host organisation, planned and performed tasks, perspectives for a thesis project, and give a presentation in the Internship Seminar in the summer term.
- If the host organisation demands a certain format of the report, the student has to comply.
- A short feedback by the local supervisor about the performance of the student during the internship is requested and recommended, but not compulsory.

- Kobusch, Ulrich (Prüfungsberechtigt)
- Tjarks, Claudia (Prüfungsberechtigt)

Prerequisites

Skills to be acquired in this module

After completing the module students will be able to:

- describe basic knowledge in two of a wide field of disciplines (technical, scientific, social, political, transferrable, language) as required for the implementation of renewable energy
- critically discuss basic principles of the implementation of renewable energy
- justify their personal decision on educational fields for their career development

Module contents

The module is designed to give students an outlook on fields which have not been covered so far in their previous lectures and specialization modules. The content from the fields of technical, scientific, social, political, transferrable, language disciplines is offered for tailoring the personal education for the planned careers. All units are 3CP units.

- Advanced Solar Energy Meteorology (Dr. Detlev Heinemann) (Lecture ? 90 h workload)
- Advanced Wind Energy Meteorology (Dr. Detlev Heinemann) (Lecture ? 90 h workload)
- Photovoltaic Systems (Hans-Gerhard Holtorf PhD) (Lecture ? 90 h workload)
- Physical Basics of Photovoltaics (Dr. Michael Richter) (Lecture ? 90 h workload)

Verwendbarkeit des Moduls
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Wollenhaupt, Matthias (Prüfungsberechtigt)
- Knipper, Martin (Prüfungsberechtigt)
- Torio, Herena (Prüfungsberechtigt)
- Wollenhaupt, Matthias (Module responsibility)
- Holtorf, Hans-Gerhard (Module responsibility)

Prerequisites

Skills to be acquired in this module

In the module Renewable Energy Project students merge the acquired scientific knowledge on different RE technologies and the concepts and methodologies they have gained in the different related disciplines and they transfer their competences to solve a real life project.

After successful completion of the module students should be able to:

- appraise the challenge of a given energy service supply problem
- assess given data of the situation of the energy service supply problem
- discriminate between valuable and less valuable input data, necessary and unnecessary data
- judge and then decide on methodologies to apply to generate a solution
- develop and then recommend a technical, economic and social solution for an energy service supply system
- explain, justify and defend the developed solution

Module contents

This module trains students to apply the knowledge acquired in previous lectures to a real life problem.

Case Study (Seminar ? 180 h workload)

Students need to

- Evaluate the state of the art at the Case Study’s project site
- Describe the energy services demanded
- Determine the energy demand to supply these services in hourly and seasonal course of time
- Design the energy supply system based on different technologies for this energy demand
- Technically & economically optimise generator size, storage size, dumped energy and unmet energy
- Write a final report for the stakeholder involved
- Present the findings to the stakeholders involved
- Solve challenges of working in an international group in order to generate a solution (project
management, conflict management, intercultural communication)

Excursion (Excursion ? 90 h workload)

The excursion refers to the case study project. Within the excursion, students collect necessary information for the completion of the Case Study itself.

Students prepare, manage and document the excursion by

- Setting up a list of institutions to be visited
- Plan the excursion route and excursion schedule
- Negotiate the necessary appointments
- Perform the excursion
- Prepare all participants for the appointments with the institutions
- Conduct the appointments
- Document the appointments
- Draw necessary conclusions for the Case Study from the excursion

Literaturempfehlungen

Language of instruction  English
Duration (semesters)  1 Semester
Module frequency  Annual, in winter semester
Module capacity  unlimited

Reference text

Specifically, the Excursion will contribute to the PPRE students' bonding amongst one another and with other students at the university of Oldenburg (specifically EP, Phy, SEM).

Furthermore, it enables insights into institutions dealing with Renewable Energy on multiple levels.

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- explain the concepts of physical processes governing the surface solar irradiance available for solar energy applications
- model the solar radiation and show their expertise in application, adaptation and development of models
- discuss state-of-the-art-methods in satellite-based irradiance estimation and solar power forecasting
- categorize and feature different PV systems (PV on-grid, PV off-grid, PV pumping, PV-hybrid)
- explain concepts behind PV system design
- explain the operation principles of PV systems

Module contents

This specialization module covers more in-depth topics concerning photovoltaics systems and solar energy meteorology. Based on their knowledge about the solar resource and photovoltaic behaviour students learn to design a photovoltaic system for various environmental conditions and predict its performance.

Solar Energy Meteorology (Lecture ? 90 h workload)

- Physics of radiative processes in the atmosphere
- Physical modelling of atmospheric radiative transfer (incl. computing tools)
- Solar irradiance modelling for solar energy applications
- Solar spectral irradiance: Theory & relevance for solar energy systems
- Satellite-based estimation of solar irradiance
- Solar irradiance (solar power) forecasting
- Solar radiation measurements: Basics & setup of high-quality measurement system

Photovoltaic Systems (Lecture ? 90 h workload)

- Detailed description of involved balance of system components (e.g. inverter, charge controllers)
- System Operation
- Detailed System Design ? from meteorological input across component rating to energy service output

**Verwendbarkeit des Moduls**
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

**Zuständige Personen**
- Heinemann, Detlev (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Kühn, Martin (Prüfungsberechtigt)
- Lukassen, Laura (Prüfungsberechtigt)
- Schmidt, Andreas Hermann (Prüfungsberechtigt)
- Stoevesandt, Bernhard (Prüfungsberechtigt)

**Prerequisites**

**Skills to be acquired in this module**

After successful completion of the module students should be able to:

- Resolve fluid dynamic problems occurring in the field of wind energy converters
- Measure characteristics of wind energy converters
- Evaluate wind energy related measurements
- Interpret such measurements gained in the field of wind energy applications
- Critically evaluate measured data

**Module contents**

This module allows students to access wind energy from the hydrodynamic view angle of the wind resource.

**Computational Fluid Dynamics (CFD) I** (Lecture ? 90 h workload)

- Navier-Stokes equations
- filtering / averaging of Navier- Stokes equations
- introduction to numerical methods
- finite- differences
- finite-volume methods
- linear equation systems
- incompressible flows
- compressible flows
- C++

**Computational Fluid Dynamics (CFD) II** (Lecture ? 90 h workload)

- Introduction to different CFD and Large Eddy Simulation (LES) models, such as OpenFOAM, PALM
- Application of these CFD models to defined problems from rotor aerodynamics and the atmospheric boundary layer
- Navier-Stokes solvers: RANS, URANS, LES, DNS
- turbulent flows
- efficiency and accuracy

Fluid Dynamics II (Lecture ? 90 h workload)
The unit is oriented towards research based topics:

- Modeling turbulence ? CFD methods: Reynolds Equation, Eddy viscosity, Boundary layers flows, Large Eddy Simulation
- Models of idealised turbulence and statistical methods: Hierarchies of moment equations, turbulence hypothesis, fine structure of turbulence, multi-fractal models, other.
- Models of turbulence: cascade models and stochastic models and other hypothesis

Wind Physics Measurement Project (Project ? 90 h workload)
Case study like problems based on real world data will be solved on at least four important aspects in wind physics. The course will comprise lectures and assignments as well as self-contained work in groups of 3 persons.
The content consists of the following four main topics, following the chronological order of the work process:

- Data handling:
  - measurement technology
  - handling of wind data
  - assessment of measurement artefacts in wind data
  - preparation of wind data for further processing

- Energy Meteorology:
  - geographical distribution of winds
  - wind regimes on different time and length scales
  - vertical wind profile
  - distribution of wind speed
  - differences between onshore and offshore conditions.

- Measure ? Correlate ? Predict (MCP):
  - averaging of wind data
  - long term correlation and long term correction of wind data
  - sources of long term wind data.

- LIDAR (Light Detection and Ranging):
  - analyses and conversion of data from LIDAR measurements

**Verwendbarkeit des Moduls**
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

**Zuständige Personen**
- Heinemann, Detlev (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Kühn, Martin (Prüfungsberechtigt)
- Waldl, Hans-Peter (Prüfungsberechtigt)

**Prerequisites**

**Skills to be acquired in this module**

After successful completion of the module students should be able to:
- critically contribute to the discourse on wind energy design and simulation
- explain and evaluate technical details of a wind energy converter
- decide and to defend a design of a wind energy converter
- recommend on technical details of a wind energy converter
- transfer their knowledge to more complex topics such as simulation and measurements of dynamic loads
- assess different aspects of wind energy farms by modelling, comparison, explanation of wind energy potential, wind energy farm’s output, power curves, wind energy project development
- assess in detail influences of meteorological/climatological aspects on the performance of wind power systems
- summarize physical processes governing atmospheric wind flows
- value atmospheric boundary layer flow relevant for wind power conversion
- argue methods for wind resource assessment and forecasting

**Module contents**

Content of the module:

The module accesses wind energy from a rather technical approach.

**Design of Wind Energy Systems (Lecture & Project ? 180 h workload)**

- Calculation of the aerodynamics of wind turbines using the blade element momentum theory,
- Specific design situations for wind turbines,
- Estimation of the influence of dynamics of a wind turbine, especially in the context of fatigue loads,
- Aeroelastic simulation of wind turbines
- Annual Energy Production (AEP)
- Design of a commercial (equivalent) wind turbine

**Advanced Wind Energy Meteorology (Lecture ? 90 h workload)**

- Atmospheric Boundary Layer (turbulence, vertical structure, special BL effects)
- Atmospheric Flow Modelling: Linear models, RANS & LES models
- Wind farm modelling
- Offshore-Specific Conditions
- Resource Assessment & Wind Power Forecasting
- Wind Measurements & Statistics

Wind Energy Applications - from Wind Resource to Wind Farm Operations (Lecture 90 h workload)

- Evaluation of Wind Resources
  - Weibull Distribution
  - Wind velocity measurements to determine energy yield
  - Basics of Wind Atlas Analysis and Application Program (WAsP) Method, Partial models using WAsP
  - Measure-Correlate-Predict (MCP) Method of long term corrections of wind measurement data in correlation to long term reference data
  - Conditions for stable, neutral and instable atmospheric conditions
  - Wind yield from wind distribution and the power curve
  - Basics in appraising the yearly wind yield from a wind turbine.

- Wake Effect and Wind Farm
  - Recovery of original wind fields in the downstream of wind turbines
  - Basics of Rise Models
  - Spacing and efficiency in wind farms
  - Positive and Negative Effects of Wind Farms

- Wind Farm Business
  - Income from the energy yield from wind farms
  - Profit optimization by increase of energy production
  - Wind farm project development
  - Wind farm operation and
  - Surveillance of power production vs. wind climate, power curves, and turbine availability

### Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- Identify and reflect their own interests and competences
- Discuss the topics of their interest/choice more profoundly
- Apply and transfer the acquired communication skills in various situations outside the classroom

### Module contents

Within this module multiple courses with a highlight on communication are offered. From the offered courses students can select multiple courses with a combined workload of 180 hours to deepen their competence in these fields of interest. The following courses are currently eligible:

- Teaching in Renewable Energies
- Deutsch,
- Kreatives Schreiben (level B1+).
- Deutsch für Naturwissenschaftler (level B1+),
- Wissenschaftliches Arbeiten - Schwerpunkt Lesen und Schreiben (level B2+)
- Wissenschaftliches Arbeiten - Schwerpunkt Sprechen und Referieren (level B2+)
- Developing and Presenting a Conference Poster
- Academic Writing
- Module 1: Writing and Publishing a Research Paper
- Basics of Project Management

### inf511 - Smart Grid Management

**Module label**: Smart Grid Management

**Modulkürzel**: inf511

**Credit points**: 6.0 KP

**Workload**: 180 h

**Verwendbarkeit des Moduls**
- Master's Programme Business Informatics (Master) > Akzentsetzungsmodule der Informatik
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
- Master's Programme Environmental Modelling (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

**Zuständige Personen**
- Lehnhoff, Sebastian (Module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

### Prerequisites

**Skills to be acquired in this module**

After successful completion of the course the students should be able to understand the existing structures and technical basis of energy systems to produce, transfer and distribute electricity and their interaction and dependency on each other. They should have developed an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems. The students are able to estimate and evaluate the requirements and challenges of ICT and computer science which are caused by the development and integration of unforeseeable fluctuations of decentralised plants. The students will be able to estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems. Regarding the requirements the students will be able to analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems.

**Professional competence**

The students:

- understand the existing structures and the technical basis of energy systems producing, transferring and distributing electricity and their interaction and dependency on each other.
- develop an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems.
- estimate and evaluate the requirements and challenges of ICT and computer science which are caused by the development and integration of unforeseeable fluctuations of decentralised plants.
- estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems.

**Methodological competence**

The students:

- analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems
- use advanced mathematical methods to calculate networks

**Social competence**

The students:

- create solutions in small teams
- discuss their solutions

**Self-competence**

The students:

- reflect their own use of electricity as a limited resource

### Module contents

Content of the Module: In this course information technology, economical energy industry and technical basic knowledge and methods are analysed by using concrete Smart Grid approaches. The basic calculation methods for an intelligent grid management are introduced.

This module deals with the technical and economical framework for a permissable electrical network as well as mathematical modelling and calculation methods to analyse conditions of electrical energy networks (in stationary conditions). These are:
• The organisation of the EU energy market (regulatory framework, responsibility in liberalisation of electrical energy systems)
• Establishment and operation of electrical energy supply networks (network topology, statutory duties of supply, supply quality/system services, malfunctions and protection systems)
• Network calculation (complex vector representation, effective/idle power, mathematical performance models/net model, transformation: node performance to node voltage and electricity, calculation of conductive current, current flow, fix-point-iteration, Newton-Raphson-Method, voltage drop, transformer model)
• Intelligent network management (Smart Grids), aggregation forms, machine learning approaches)

Verwendbarkeit des Moduls
- Master's Programme Environmental Modelling (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen
- Agert, Carsten (Prüfungsberechtigt)
- Jimenez Martinez, Cuauhtemoc Adrian (Prüfungsberechtigt)
- Torio, Herena (Prüfungsberechtigt)
- Agert, Carsten (Module responsibility)
- Torio, Herena (Module responsibility)

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- analyze, and critically understand different definitions of resilience and fundamental concepts relevant in the context of energy systems analysis (e.g. complexity, homeostasis, equilibria, stressors, …)
- understand and interlink assessment methods, principles and theories for resilience analysis of energy supply systems in different scientific disciplines
- critically evaluate the suitability, meaningfulness and implications of different resilience-related indicators, theories and assessment methods from several disciplines
- develop a scientific discourse on suitable approaches for assessing particular aspects of a resilient energy system design in the context of a particular real-life case study
- identify main barriers, potentials and driving factors for improving one selected assessment approach in the context of its application to a case study
- perform a literature review, apply a selected resilience and extract the main related conclusions, arguing critically on them
- present scientific results and conclusions both verbally and in written form, including quotation to a professional standard

Module contents

The module “Resilient energy systems” provides the theoretical background for understanding main concepts and interdisciplinary scientific methods from the context of resilience assessment as well as their role in the debate towards resilient energy systems.

Resilient Energy Systems (Lecture & Seminar, 180 h workload):

- Definitions and fundamental concepts in resilience analysis of energy systems (complexity, homeostasis, equilibria, feedback loops, …)
- Approaches and methods for resilience assessment from different relevant disciplines:
  - epistemic approaches
  - resilience as guiding principle
  - aggregation methods for resilience assessment
  - cyber-security and informatics
- environmental modelling
- risk and vulnerability analysis
- agent-based models
- governance studies

56 h
phy609 - Photovoltaic Physics

Module label | Photovoltaic Physics
Modulkürzel | phy609
Credit points | 6.0 KP
Workload | 180 h
  { Attendance: 56 hrs, Self study: 124 hrs }
Verwendbarkeit des Moduls | • Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
  • Sustainable Renewable Energy Technologies (Master) > Mastermodule
Zuständige Personen | Kühn, Martin (Module responsibility)
  Gödaj, Levent (Prüfungsberechtigt)
  Richter, Michael (Prüfungsberechtigt)
Prerequisites | Solid-state Physics, semi-conductor Physics, Module Renewable Energy Technologies I
Skills to be acquired in this module | describe schematically the events around the pn-junction under bias in the dark and under illumination,
calculate the width of the space charge region, use solar cell data sheets in their professional career, discuss
the concepts of solar cell materials, design and optimization, choose a PV technology for a given project
Module contents | This specialization module covers the physics of photovoltaics. The behaviour of solar cells is discussed from a
fundamental physical point of view to explain the differences in performance and limits of various photovoltaic
materials. Students learn how solar cells function, are designed and optimized, Optical and electronical
properties of semiconductors, light absorption, Charge carrier generation/recombination/life time, Charge carrier
transport across the pn-junction in equilibrium and under light and voltage bias, Transport equations, Current-
voltage characteristics, efficiency, Quantum efficiency, Design concepts to
optimize the efficiency, Overview of the most important PV technologies
Literaturempfehlungen | S. Hegedus, A. Luque, Handbook of Photovoltaic Science and Engineering, published John Wiley and Sons
  (2nd Edition 2011);

## Verwendbarkeit des Moduls
- Master’s Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
- Master’s Programme Environmental Modelling (Master) > Mastermodule
- Master’s Programme European Master in Renewable Energy (EUREC) (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

## Zuständige Personen
- Agert, Carsten (Module responsibility)
- Knipper, Martin (Module responsibility)
- Knipper, Martin (Prüfungsberechtigt)
- Torio, Herena (Prüfungsberechtigt)

## Prerequisites
After successful completion of the module students should be able to:
- characterize the global energy system and analyze the structure and constraints of today’s energy system,
- explain the availability and connection between solar and wind energy,
- identify the problems and challenges of energy supply due to fluctuating energy resources with varying and seasonal load profiles,
- relate the solar irradiance conversion process as well as the atmospheric radiation balance of the earth to Wind Energy Meteorology.

## Module contents
This module will give an overview on the global energy system and the challenges of energy supply due to fluctuating energy resources with varying and seasonal load profiles.

### Energy Meteorology (Lecture - 90 h workload)

#### Section I: Solar Irradiance
- Radiation laws,
- Solar geometry,
- Interaction of solar irradiance with the atmosphere,
- Radiation climatology,
- Solar radiation model,
- Statistical properties of solar irradiance,
- Measuring devices to ascertain solar radiation balance,
- Satellite-supported data acquisition to assess solar irradiance,

#### Section II: Wind Flow
- Origin and potential of atmospheric energy movements, Heat balance of the atmosphere,
- Physical laws of atmospheric flow,
- Wind circulation in the atmosphere, local winds,
- Wind flow in atmospheric layers (vertical structure, Ekman Layer),
- Assessment of wind potential (European Wind Atlas: model, concept,
- Wind Measurements,

### Energy Systems (Lecture - 90 h workload)
- Definitions, separation electrical - thermal energy use,
- Resources and reserves,
- Energy system analysis: Efficiencies at various levels of the energy chain; Exergy analysis,
- Energy scenarios,
- Climate change,
- Advanced (power plant) technologies for conventional fuels,
- Electric power systems with large shares of renewables

phy647 - Future Power Supply Systems

Module label: Future Power Supply Systems

Modulkürzel: phy647

Credit points: 6.0 KP

Workload: 180 h

Verwendbarkeit des Moduls:
- Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
- Master's Programme Environmental Modelling (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen: Agert, Carsten (Prüfungsberechtigt)

Prerequisites:
- Knowledge from module RE technology I, Mathematics

Skills to be acquired in this module:
After successful completion of the module students should be able to:

- explain the management, power balancing and the provision of ancillary services within future electricity grid configurations with high shares of fluctuating and distributed generation
- perform power system simulation with related software tools
- describe different grid-designs, including mini- and microgrids
- compare different markets for electricity (Futures Market, Day-Ahead-Market, Intraday-Market, Balancing Power Market, Self-Consumption) and assess the suitability of these concepts for promoting the implementation of higher shares of fluctuating distributed power generation within the electricity grid.
- explain the technical principles and resulting limiting factors of concepts and components required for power control within "Smart City", "Smart Grid", and "Smart Home" concepts

Module contents:
Future Power Supply Systems:

- Technology and characteristics of conventional power plants based e.g. on coal, gas, and nuclear,
- Fundamentals, structure, technologies and operation of (AC-) electricity grids (incl. balancing power, voltage management, etc.),
- Fluctuating distributed generation: Characteristics and solutions on the transmission and distribution grid levels, incl. storage, vehicle-to-grid-concepts, smart inverters, heat pumps / CHP, etc,
- Interactions between technology and economics: The different electricity markets (Futures Market, Day-Ahead-Market, Intraday-Market, Balancing Power Market, Self-Consumption) and their links to the physical world, - "Smart City", "Smart Grid", "Smart Home", - Mini- and Micro-Grids,
- Energy scenarios and modelling,
- Chemical energy carriers in the energy system: power-to-gas (e.g. methane) and power-to-liquids (e.g. methanol)

**Verwendbarkeit des Moduls**
- Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

**Zuständige Personen**
- Kühn, Martin (Prüfungsberechtigt)
- Kühn, Martin (Module responsibility)

**Prerequisites**
Basics in Wind Energy Utilisation

**Skills to be acquired in this module**
- Design of Wind Energy Systems:
  - The students attending the course will have the possibility to expand and sharpen their knowledge about wind turbine design from the basic courses. The lectures include topics covering the whole spectrum from early design phase to the operation of a wind turbine. Students will learn in exercises how to calculate and evaluate design aspects of wind energy converters.
  - At the end of the lecture, they should be able to:
    1. estimate the site specific energy yield,
    2. calculate the aerodynamics of wind turbines using the blade element momentum theory,
    3. model wind fields to obtain specific design situations for wind turbines,
    4. estimate the influence of dynamics of a wind turbine, especially in the context of fatigue loads,
    5. transfer their knowledge to more complex topics such as simulation and measurements of dynamic loads,
    6. calculate the economic aspects of wind turbine

- Aeroelastic Simulation of Wind Turbines:
  - A student who has met the objectives of the course will be able to:
    1. understand the basic concept of an aero-servo-elastic computer code to determine the unsteady aerodynamic loads, derive and validate the required parameters to model the aero-hydro-elastic response of a wind turbine, identify and interpret the required empirical parameters to correct the blade element momentum (BEM) method with respect to dynamic in flow, unsteady airfoil aerodynamics (dynamic stall), yawed flow, dynamic wake modeling, explain the effects of the different models on the resulting time series and validate the code, interpret design standards for on- and offshore wind turbines,
    2. select the required load cases according to site specific environmental data, identify the dimensioning load cases and calculate design loads for different main components of a wind turbine.

**Module contents**
- Design of Wind Energy Systems
  - Introduction to industrial wind turbine design, rotor aerodynamics and Blade Element Momentum (BEM) theory,
  - dynamic loading and system dynamics, wind field modelling for fatigue and extreme event loading, design loads and design aspects of onshore wind turbines, simulation and measurements of dynamic loads, design of offshore wind turbines, power quality and grid integration on wind turbines.
- Aeroelastic Simulation of Wind Turbines:
  - The course focuses on the practical implications and hands-on experience of the aero-hydro-servo-elastic modelling and simulation of wind turbines. The subjects are similar but the treatment is complementary to the parallel course ‘Design of Wind Energy Systems’, which deals with the underlying theoretical background: advanced wind field modelling for fatigue and extreme event loading, modelling of wind farm flow and wake effects, rotor aerodynamics (e.g. stationary or dynamic effects, comparison of Blade Element Momentum theory and more advanced methods like free vortex methods or CFD), structural dynamics and dynamic modelling of wind turbine structures (modelling by ordinary or partial differential equations, stochastics, multi body system modelling), advanced control of wind turbines, design standards, design loads and design aspects of off-shore and onshore wind turbines. The students analyse in pairs a model of an entire wind turbine with the aid of a typical wind turbine design tool like GH Bladed, Flex5 or Aerodyn/FAST.

pre014 - Fundamentals for Renewable Energy

Module label | Fundamentals for Renewable Energy
---|---
Modulkürzel | pre014
Credit points | 6.0 KP
Workload | 180 h

Verwendbarkeit des Moduls
- Master's Programme European Master in Renewable Energy (EUREC) (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen
- Torio, Herena (Module responsibility)
- Torio, Herena (Prüfungsberechtigt)
- Hoppmann, Jörn (Prüfungsberechtigt)
- Günther, Andreas (Prüfungsberechtigt)
- Ziethe, Paul (Prüfungsberechtigt)

Prerequisites
After successful completion of the module, students should be able to:
- develop a basic understanding and skills for programming in languages relevant for energy systems analysis and modelling (Python)
- understand and apply fundamental approaches for modelling energy systems (statistical and analytical models)
- understand the most important economic principles
- have a basic understanding of the functioning of energy markets
- have an overview of the types and effectiveness of policies to promote renewable energy technologies
- understand the interaction between society and renewable energy technologies
- know which aspects play an important role when founding renewable energy start-ups and developing corporate strategies in the renewable energy sector
- be able to assess alternative investment and financing possibilities in the context of renewable energy

Module contents
The module is designed to give students a solid foundation to successfully start the MSc programme. The compulsory content from the fields of Energy Systems Modelling and Programming, as well as energy economics and management intends to provide a homogeneous knowledge base in these fields.

The compulsory content of the Primers course provides a basic introduction to Python as one of the leading programming languages in the fields of energy system analysis as well as a sound introduction to fundamental modelling approaches used in energy system analysis. These two topics provide a solid basis required for understanding the content of the provided specializations during the summer term. Additional optional materials within this course include videos, scripts and exercises in the fields of electric power systems analysis, thermodynamics, fluid dynamics or solid-state physics and are provided as optional self-learning materials that can be used on demand by the students to update their knowledge on these fundamental fields.

The course “Renewable Energy Management” offers an introduction to the most important areas relevant to the management of renewable energy companies. To this end, the course first provides a general introduction to economic fundamentals and principles. Students then gain insights into the following topics:
- Energy markets
- Renewable energy policy and climate policy
- Foundation and strategies of renewable energy companies
- Investment and financing in the renewable energy sector
- Innovation management in the renewable energy sector

Each of these topics will be explored in depth through practical exercises, including guest lectures, simulations, stakeholder discussions, case studies and investment calculations.

- Agert, Carsten (Module responsibility)
- Knipper, Martin (Module responsibility)

Prerequisites

Skills to be acquired in this module

After successful completion of the module students should be able to:

- perform laboratory measurements in a university environment according to scientific standards
- present a sound analysis of the results and related conclusions in a scientific report
- analyse and interpret measurement results using relevant and widely used software tools
- work and communicate their results with international and interdisciplinary partners

Module contents

Laboratories (Theoretical?practical Seminar ? 120 h workload)

- Introductory Laboratory
- Interaction Light and Matter
- Heat Transfer
- Fluid Dynamics
- Storage Technologies
- Scientific Writing

### Module: Solar Energy

**Module label**: Solar Energy  
**Modulkürzel**: pre022  
**Credit points**: 6.0 KP  
**Workload**: 180 h  
**Verwendbarkeit des Moduls**:  
- Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies  
- Master's Programme Environmental Modelling (Master) > Mastermodule  
- Sustainable Renewable Energy Technologies (Master) > Mastermodule  

**Zuständige Personen**:  
- Torio, Herena (Prüfungsberechtigt)  
- Knipper, Martin (Prüfungsberechtigt)  
- Torio, Herena (Module responsibility)  
- Agert, Carsten (Module responsibility)

**Prerequisites**

**Skills to be acquired in this module**

After successful completion of the module students should be able to:

- understand, describe and compare major technologies for solar energy use: solar thermal and photovoltaic systems  
- analyse various system components and their interconnections within a solar energy system.  
- critically appraise and assess various technologies for solar energy use and components involved in such solar systems.  
- size and evaluate the performance of solar systems as a function of their operation conditions, components and system layout  
- critically evaluate non-technical impact and side effects when implementing renewable energy supply systems

**Module contents**

This module gives an overview on solar thermal and photovoltaic technologies. Main focus hereby are the scientific principles of components and their technical description as well as first suitable system performance assessment methods.

**Photovoltaics (Lecture: 90 h workload)**

**Physics of PV**:

- Basic and most important properties of solar radiation related to photovoltaics  
- PV cells basics: Fundamental physical processes in photovoltaic materials  
- Characterization and basic modelling of solar cells  
- Component Description: PV generator; Charge controller; Inverter; Balance of system components; System Description  
- Grid Connected System  
- Stand Alone System

**Solar Thermal Energy (Seminar & Exercises: 90 h workload)**

- Assessment of solar thermal ambient parameters: regional global, diffuse, reflected solar
radiation on horizontal and on tilted plane, ambient temperature

- Solar thermal system components: collectors; heat exchangers; thermal storage; thermally driven compression chillers
- Solar cooling systems and components
- Characterization of solar thermal systems, their operation and performance
- F-Chart and Utilizability methods as main methods for assessing system performance

- Hölling, Michael (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Agert, Carsten (Module responsibility)
- Holtorf, Hans-Gerhard (Module responsibility)

**Prerequisites**
After successful completion of the module students should be able to:

- Critically evaluate and describe basic characteristics and functioning of wind energy converters
- Understand the physical principal of wind energy conversion
- Understand wind turbine aerodynamics
- Critically evaluate and describe electrochemical storage systems with a focus on batteries as well as hydrogen storage systems (electrolyser, gas storage and fuel cells)

**Module contents**

**Basics of Wind Energy:**
- Wind characterization and anemometers
- Aerodynamic aspects of wind energy conversion
- Wind turbine performance
- Design of wind turbines
- Dimensional analysis and pi-theorem

**Energy Storage:**
- Fundamentals of electrochemistry and thermodynamics
- Energy and environmental balances
- Basics of hydrogen production (materials, processes, efficiencies, environmental impacts)
- Basics of fuel cells (function, materials, construction, systems applications)
- Basics of hydrogen storage systems (their setup, control, safety aspects)
- Fundamental setup of most common battery types
- Fundamental chemical reactions in these batteries
- Operational characteristics of batteries (charging & discharging, weir processes and service lives).

pre042 - Water and Biomass Energy

Module label: Water and Biomass Energy
Modulkürzel: pre042
Credit points: 6.0 KP
Workload: 180 h
Verwendbarkeit des Moduls:
- Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
- Master's Programme Environmental Modelling (Master) > Mastermodule
- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen:
- Wark, Michael (Prüfungsberechtigt)
- Holtorf, Hans-Gerhard (Prüfungsberechtigt)
- Pehlken, Alexandra (Prüfungsberechtigt)
- Wark, Michael (Module responsibility)
- Holtorf, Hans-Gerhard (Module responsibility)

Prerequisites:
Skills to be acquired in this module:

After the completion of the module students should be able to:

- critically evaluate and compare two Renewable Energy conversion processes which allow continuous power supply on demand (hydropower and biomass energy)
- confront those systems to a Renewable Energy conversion process with intermittent output (marine power)
- discuss extreme situations in Renewable Energy systems' source and transfer such situations to other Renewable Energy systems
- analyse various system components and their interconnections within a complex Renewable Energy supply system,
- evaluate the Renewable Energy supply systems' operational size and efficiency,
- critically evaluate non-technical impact and side effects when implementing renewable energy supply systems
- understand the basic chemical background of bioenergy-related materials, systems and processes

Module contents:

Biomass Energy (Lecture - 90 h workload)
- Energy mix overview; gas, heat, electricity, Pros and Cons, of biomass,
- Chemical composition of biomass: sugar, cellulose, starch, fats, oils, proteins, lignin,
- Natural photosynthesis in plants: chemical storage of solar energy; general mechanisms,
- Chemistry and Biology (microorganism) of Biogas Technology,
- Conversion processes of biomass: classification, main pathways,
- Introduction to catalysis used in biomass conversion,
- Chemical fuels (chemical energy storage) from biomass,
- Routes to platform chemicals and separation processes,
Technology concepts for bioenergy usage,
Introduction into economical and legal constraints.

Hydro and Marine Power (Lecture + Excursion - 90 h workload)

Revision of hydraulic basics and their application to hydro and marine power.
Hydropower and marine power resources and their representation
Technological and economical state of the art.
Description of such systems' components, their characteristics, their interaction in a system, their main features and their challenges

Skills to be acquired in this module

After completing the module students will be able to:

- describe basic knowledge in two of a wide field of disciplines (technical, scientific, social, political, transferrable, language) as required for the implementation of renewable energy
- critically discuss basic principles of the implementation of renewable energy
- justify their personal decision on educational fields for their career development

Module contents

The module is designed to give students an outlook on fields which have not been covered so far in their previous lectures and specialization modules.

The content from different disciplines allows deepening knowledge and skills in the fields of technology, natural and social sciences, policy-making, transferrable and personal development skills, and languages. It intends to allow students tailoring their personal education for their professional careers.

A selection of examples of courses eligible in this module are:

All SuRE specialization lectures (beyond the own specialisation lectures), Ecological Economics, International Environmental Governance or any university language courses.

Literaturempfehlungen Refer to selected lectures within pre064

**Prerequisites**

**Skills to be acquired in this module**

After successful completion of the module students should be able to:

- categorize and feature different PV systems
  - PV on-grid,
  - PV off-grid / stand alone,
  - PV-pumping,
  - PV-hybrid
  - by their setup and by standard quality indicators.

- explain the operation principles of the listed PV systems
- explain concepts behind PV system design
- design a photovoltaic system by Fermi Estimate
- design a photovoltaic system by a simulation software
- be aware of the limitation of both design methods
- discuss energy flow diagrams of PV systems
- describe in depth involved balance of system components e.g.
  - inverter,
  - charge controllers
  - cabling
  - generator stand
  - storage battery with a focus on housing (ventilation)

**Module contents**

This specialization module covers more in-depth topics concerning photovoltaics systems.
The module consists of:

**Photovoltaic Systems Lecture (90h workload)**

Description and operation of PV System's balance of system components

- inverter,
- charge controllers
- cabling
- generator stand
- storage battery with a focus on housing (ventilation)

Quality indicators for PV Systems and their regional differences

- PV on-grid,
- PV off-grid / stand alone,
- PV-pumping,
- PV-hybrid

Sizing of PV systems – back of the envelope approach as well as by a simulation software

**Photovoltaic Systems Seminar (90h workload)**

Within the seminar groups of up to five students select a PV system related research question, work on the solution and present their findings.

In addition, external PV experts are invited to present from their work experience.

An excursion to a PV power plant concludes the lessons learned in the field.

Skills to be acquired in this module

After successful completion of the module students should be able to

- explain the concepts of physical processes governing the surface solar irradiance available for solar energy applications
- model the solar radiation and show their expertise in application, adaptation and development of models
- discuss state-of-the-art-methods in satellite-based irradiance estimation and solar power forecasting
- discuss and present state of the art of the application of modern solar energy meteorology on a wide range (from residential systems to solar power plants, from solar thermal to photovoltaic systems)

Module contents

This specialization module covers more in-depth topics concerning solar energy meteorology.

Based on students' knowledge about the solar resource, solar thermal and photovoltaic technology, students deepen their knowledge on the resource for such systems.

I. Adv. Solar Energy Meteorology (Lecture - 90 h workload)

- Physics of radiative processes in the atmosphere
- Physical modelling of atmospheric radiative transfer (incl. computing tools)
- Solar irradiance modelling for solar energy applications
- Solar spectral irradiance: Theory and relevance for solar energy systems
- Satellite-based estimation of solar irradiance
- Solar irradiance (and solar power) forecasting
- Solar radiation measurements: Basics and setup of high quality measurement system
II. Solar Energy Meteorology Applications (Lecture and Seminar – 90h workload)

- sources of solar data and discussion of their quality
- solar resource assessment:
  o basic models,
  o measurements,
  o satellite models
  o data sets
- validation and application of solar resource data sets
- forecasting of solar radiation: sky-camera forecasts, satellite-based forecasts, numerical weather predictions, statistical methods
- forecast validation
  - selected applications
- irradiance and PV power forecasting
- application of solar resource data for yield assessment

---

The module pre023, Solar Energy, focuses on sustainable renewable energy technologies. It offers 6.0 credit points and requires 180 hours of workload. The module is part of the Sustainable Renewable Energy Technologies (Master) program and can be taken as an elective. It is taught in German and lasts for 1 semester. The module level is Master (MM), and it is unlimited in capacity. The form of instruction is a seminar, and the final exam is a seminar. The module is offered in the spring or winter semesters.

Verwendbarkeit des Moduls

- Sustainable Renewable Energy Technologies (Master) > Mastermodule

Zuständige Personen

Holtorf, Hans-Gerhard (Module responsibility)
Agert, Carsten (Module responsibility)
Holtorf, Hans-Gerhard (Prüfungsberechtigt)

Prerequisites

Skills to be acquired in this module

After completing the module students will be able to:

- describe basic knowledge in two of a wide field of disciplines (technical, scientific, social, political, transferrable, language) as required for the implementation of renewable energy
- critically discuss basic principles of the implementation of renewable energy
- justify their personal decision on educational fields for their career development

Module contents

The module is designed to give students an outlook on fields which have not been covered so far in their previous lectures and specialization modules.

The content from different disciplines allows deepening knowledge and skills in the fields of technology, natural and social sciences, policy-making, transferrable and personal development skills, and languages. It intends to allow students tailoring their personal education for their professional careers.

A selection of examples of courses eligible in this module are:

All SuRE specialization lectures (beyond the own specialisation lectures), Ecological Economics, International Environmental Governance or any university language courses.

Literaturempfehlungen

Refer to selected lectures within pre064

Prerequisites

Skills to be acquired in this module

The master thesis module finalizes and concludes the master programme. The student presents the achieved results as a written thesis and defends the results / conclusions to a board of examiners.
As a general objective for the Master Thesis, the student shall demonstrate the ability to constructively, critically and independently formulate, discuss and communicate issues at stake, integrating theory and methodology related to Renewable Energy.

As specific competency objectives within the Master Thesis, after completion the student shall be able to:

- demonstrate knowledge of relevant and latest publications concerning the selected topic
- elaborate the Master Thesis on the basis of clearly formulated, general objectives and specific characteristics of the topic
- identify and put to use in an operational manner empirical or other scientific material and methods that are appropriate in relation to the subject
- develop a balanced discussion of material, methods, results and possible consequences of these in relation to the field of Renewable Energy
- present the Master Thesis orally and defend the results and conclusions in a critical discussion

The module is designed to apply and deepen the methodologies acquainted throughout the PPRE programme to a specific scientific problem given by the supervisor. In order to achieve a result the student needs to apply scientific as well as key-competencies described in the next section.

Students have understood the scientific problem, they have learned the ropes of the problem, they have selected, acquainted or deepened a set of scientific and methodologies and key-competencies necessary to solve the problem and they have applied those methods.

The publication of thesis results is appreciated.

Module contents

The Master Thesis finalises the course of studies within PPRE.

Master Thesis Colloquium (Colloquium 180 h workload)
- Skills for thesis elaboration
- negotiation of conditions & rules with the supervisors
- setting the scene
- scientific writing,
- literature research & management (database),
- time management,
- communication with involved stakeholders,
- networking with helpful partners,
- development of research question
- Presentation and discussion of thesis project proposal (own and other students' project proposals)
- Finalizing discussion with network (PPRE colleagues, friends and supervisors)
