| Prerequisites | Enrolment in Master's programme Molecular Biomedicine |
| Skills to be acquired in this module | Goals of the Module: Upon successful completion of this module, students know and understand cellular and subcellular structures and their function in the human body. |
| | Competencies: ++ deepened biological expertise ++ deepened clinical / pathological expertise, ++ deepened knowledge of biological working methods ++ deepened knowledge of clinical / pathological diagnostics, + interdisciplinary thinking, + critical and analytical thinking, + ability to perform independent biological research + ethics and professional behaviour |
| Module contents | |
| | The module aims to give students an insight into microscopic functional anatomy. In this module, we will cover aspects of cell compartmentalisation and tissue organisation as the basis for normal function and homeostasis. In addition, we will cover examples of organ organisation and organ function. To introduce students to clinical concepts, and to deepen their understanding of the functional roles of cells and tissues, we will also cover aspects of the pathological basis of disease for selected organs and organelles. In the accompanying seminar, students will have the chance to work on light and electron microscopic pictures, to practice annotation and identification of cells and tissues. In addition, the students will read and present original literature. This will introduce select aspects of disease, but also introduce research methodology and scientific thinking. This course is not a full histology course, but it serves as an introduction to the topic, recapitulates aspects of cell biology and introduces a few select aspects of pathology. |

| Skills to be acquired in this module | | Competencies: ++ deepened biological expertise ++ deepened knowledge of biological working methods ++ data analysis skills + interdisciplinary thinking ++ critical and analytical thinking ++ independent searching and knowledge of scientific literature + data presentation and discussion (written and spoken) |
| Module contents | | The module focuses on auditory neuroscience, molecular and cellular neurobiology. |
| | | Lecture: Development, anatomy and function of the auditory system (cochlea to cortex), classification, molecular causes and inheritance of auditory disorders, investigation of these disorders in animal models, insights into possibilities of treatment/therapy |
| | | Seminar: The seminar will focus on possibilities of treatment options in the field of auditory rehabilitation. In a flipped classroom, students will shortly present and discuss different approaches. |
| | | Exercise: Laboratory experiments to study mouse models of deafness/auditory processing disorders |

| Prerequisites | Basic knowledge of neurobiology |
| | ++ Expt. Methods + Independent research ++ Scient. Literature + Social skills + Maths/Stats/Progr. ++ Data present./disc. + Scientific English + Ethics |
| | Upon successful completion of this course, students |
| | have basic knowledge of electrophysiological techniques used in neuroscience research have acquired first practical skills in some electrophysiological techniques have acquired basic skills in data analysis have knowledge on retinal physiology and anatomy of the visual system have basic knowledge of brain structures and their function have profound knowledge of the architecture and circuits of the vertebrate retina have aquired basic skills in histological techniques (tissue fixation, embedding, sectioning, |
| | staining procedures, immunohistochemistry) |
| | have aquired fundamental skills in microscopy (differential interference contrast microscopy, |
| | phase-contrast microscopy, confocal microscopy) |
| Module contents | The background module Neurophysiology consists of two weeks of theoretic introduction and two weeks of hands-on lab exercises in patch or extracellula recordings and two weeks of hands-on lab exercises in anatomy. |
| | The seminars cover the following topics: • Visual system • Introduction to electrophysiological methods • Introduction into methods used in neuranatomy and neurochemistry • Introduction into microscopy and image analysis • Presentation and discussion of results relating to the literature |
| | Course scripts and mandatory scientific literature discussed in the seminar w |

Background and seminar literature will be available in Stud.IP.

| Verwendbarkeit des Moduls | Master's Programme Molecular Biomedicine (Master) > Background Modules |
| Zuständige Personen | Loser, Karin (module responsibility) Loser, Karin (Prüfungsberechtigt) Mykicki, Nadine (Prüfungsberechtigt) |
| Prerequisites | Enrolment in Master's programme Molecular Biomedicine Basic knowledge in primary cell culture, quantitative real-time PCR, flow cytometry or histology would be highly desirable. |
| Skills to be acquired in this module | Goals of this module: After completing this module, students are able to perform experimental approaches necessary to investigate selective immunological questions. These will comprise the normal function of the healthy immune system as well as processes leading to immune system dysregulation or immune system dysfunction in several systemic or organ specific diseases. Based on the basic knowledge of immunology acquired in the module students will be able to understand and analyze specific scientific problems, plan experimental approaches accordingly, and perform the experiments. Skills to be acquired/ competencies: ++ Deepened biological expertise ++ Deepened clinical expertise ++ Deepened knowledge of biological working methods + Deepened knowledge of clinical diagnostics ++ Data analysis skills + Interdisciplinary thinking ++ Critical and analytical thinking + Independent searching and knowledge of scientific literature + Ability to perform independent biological research ++ Data presentation and discussion (written and spoken) + Teamwork + Project and time management |
| | Methods: Key methods learned and implemented in this module include - Primary cell culture and cell separation - RNA extraction, reverse transcription and quantitative real-time PCR - Tissue sectioning, immunohistology and immunofluorescence staining including microscopy - Multicolor flow cytometry - Quantification of soluble factors and inflammatory mediators using multipley |
| Module contents | assay techniques Lecture: Regulation of innate and adaptive immune responses in healthy individuals Dysregulation of the immune system in inflammatory diseases, cancer or autoimmunity Impact of the environment on immune regulation |
| | Seminar: - Presentation and discussion of laboratory methods used in the practical part Exercise: This module involves working on small research projects in groups of 2-3 students. The projects include basic immunology in humans and mice with the goal of better understanding the development of allergy, sterile inflammation of autoimmunity as well as immune regulation during cancer or infection. Using the knowledge of immune regulation gained in the lecture and seminar, students will analyze and evaluate specific scientific problems. Required methods of immunology, cell and molecular biology (e.g., flow cytometry, cell separation, isolation and culture of primary immune cells, gene expression studies, histology) are taught and used. |

Prerequisites

Skills to be acquired in this module

Upon successful completion of this course, students

- · know the fundamental problems organisms share in development
- know the common basic steps of ontogenesis after comparing the life cycles of different species (both vertebrates and invertebrates)
- know the fundamentals of the genetic control of cell-fate specification, morphogenesis, and organogenesis
- know the principles of gene regulatory networks in development and are able to explain examples
- are able to explain and discuss mechanisms of development across taxonomic groups and questions about the evolution of developmental mechanisms
- have in-depth knowledge of the development of animal nervous systems, including cellular and net-work properties

skills:

- ++ deepened biological expertise
- + deepened knowledge of biological working methods
- ++ interdisciplinary thinking
- ++ critical and analytical thinking
- + independent searching and knowledge of scientific literature
- + ability to perform independent biological research
- + teamwork

Module contents

Lectures on the fundamentals and concepts of developmental biology, including evolutionary aspects. Parallel seminars matching the topics of the lectures and emphasizing discussion. Lecture topics:

- Introduction to Developmental Biology
- Cell-Cell Communication
- Differential Gene Expression (I and II)
- · Early Development of Vertebrates, Gastrulation
- Neurulation
- Brain Development
- · Axonal Growth, Target Selection, Synaptogenesis and Refinement
- Neural Crest
- Mesoderm Development
- Morphogenesis
- Developmental Mechanisms of Evolutionary Change
- Model Organisms in Developmental Biology
- Transgenic Mice
- Medical Implications of Developmental Biology

| Zuständige Personen | Rauch, Bernhard (module responsibility) Rauch, Bernhard (Prüfungsberechtigt) Meyer, Ulrike (Module counselling) | |
| Prerequisites | Enrolment in Master's programme admission requirement is attendance of the gsw230 module ("Lecture Molecular Pharmacology") Places are based on attended module "Lecture Molecular Pharmacolo given grades. Knowledge of physiology and biochemistry is required. | |
| Skills to be acquired in this module | Upon completion of this module, students - have fundamental knowledge of good laboratory practice. - have an in-depth understanding of different working methods in the laboratory. - understand basic parameters of studies and the importance for basic research and therapeutic approaches. | с |
| | Skills to be acquired/ competencies: ++ deepened biological expertise ++ deepened clinical expertise ++ deepened knowledge of biological working methods ++ data analysis skills ++ critical and analytical thinking + deepened knowledge of clinical diagnostics + interdisciplinary thinking + independent searching and knowledge of scientific literature + data presentation and discussion (written and spoken) + teamwork + ethics and professional behavior | |
| Module contents | Fundamentals of experimental pharmacology, common analytical lattechniques in this area Explanation of the pathophysiological mechanisms of diseases and to corresponding molecular drugs targets Specific knowledge on selected current research topic in the field of experimental pharmacology Knowledge of basic parameters of clinical studies and understanding importance of clinical studies for therapeutic approaches | the |

| Prerequisites | Enrolment in Master's programme Molecular Biomedicine |
| Skills to be acquired in this module | Goals of the Module: Upon successful completion of this module, students - know about epigenetic regulation of gene transcription - can determine different epigenetic features - have a basic understanding of the role of epigenetics in human disease Competencies: ++ deepened biological expertise + deepened clinical expertise ++ deepened knowledge of biological working methods |
| | + deepened knowledge of clinical diagnostics + data analysis skills + critical and analytical thinking + ability to perform independent biological research + data presentation and discussion (written and spoken) + teamwork |
| Module contents | Lecture: - introduction to epigenetics - regulation of gene expression - developmental epigenetics - cancer epigenetics - current methods - ethics |
| | Seminar: - presentation of important historical and current primary literature - presentation and discussion of lab methods used in the practical part Exercise: - Designing bisulfite PCR strategies for methylated DNA - analyses of datasets - DNA isolation from cells - <i>in vitro</i> methylation of DNA - methylation-specific restriction analysis (and PCR) - methylation-specific bisulfite PCR - histone characterization |

| Enrolment in Master's programme Molecular Biomedicine |
| Goals of the Module: Upon successful completion of this module, students are familiar with the basic epigenetic mechanisms know the principles of different sequencing techniques, both for genetic are epigenetic research are familiar with the "first 1000 days of life concept" and how the early environment influences long term health know how the human body is colonized know about the basic mechanisms involved in CNV development during fetal and early postnatal life know about the nent-invasive methods used to study functional brain development know about the nent-invasive methods used to study functional brain development know about the enchanism of the neurovascular response know about the cell types, cellular interactions and molecular changes during peripheral nerve; degeneration and regeneration following nerve traum are able to explain some oncogenic mechanisms of viruses can explain preeclampsia and its immunological regulation are familiar with antibiotic classes, mode of actions of antibiotic, principle of antibiotic resistance, dissemination of current plasmids causing multi-resistance know about differences between susceptibility, tolerance, resistance and persister cells and mechanisms of persister cell formation, and current medic treatment strategies are able to explain the concept of cancer immunosurveillance and immunoedling are able to explain the mechanisms underlying therapy resistance in malignant diseases, particularly cancers of the gastrointestinal tract and the hepatico-panceatico-bilary system can explain current strategies in immunotherapy of cancer including checkpoint inhibition, CAR T cell therapy and cancer vaccination are able to explain the mechanisms underlying therapy resistance in malignant diseases, particularly cancers of the gastrointestinal tract and the hepatico-panceatico-bilary system can explai |
| The module focuses on molecular aspects as part of current clinical research different fields. |
| |

Lectures: (Part 1)

| | | Genetic and epigenetic sequencing technology Epigenetic programming by early life events The human microbiome and colonization of the human body Molecular insights into functional brain development Basic mechanisms involved in CNS development during fetal and early postnatal life Introduction to methods used to study molecular signaling Introduction to non-invasive methods used to study functional brain development (Part 2) Contribution of the immune system to the progression of infection, autoimmunity, cancer or (neuro-) inflammation Modulation of the immune system as a potential therapeutic option Interaction of the microbiomed with the immune system and impact of environmental factors on the development of immune-mediated diseases (Part 3) Oncogenic potential of viruses (e.g. Cervix carcinoma caused by HPV viruses) Molecular insights into carcinogenesis Preeclampsia and it's immunological regulation (Part 4) Concept of cancer immunosurveillance and immunoediting Current strategies for cancer diagnosis and liquid biopsy (Part 5) Insights into antibiotic resistance (mode of antibiotics, principles of antibiotic resistance) Emergence of multi-resistance and dissemination of plasmids causing multi-resistance Differences between susceptibility, tolerance, resistance and presistence of pathogens to antibiotics Current hypotheses of inducers for persister cell formation and medicl treatment (Part 6) Neurovascular regulation in response to cerebral ischemia |

| Zuständige Personen | Griesinger, Frank (module responsibility) Griesinger, Frank (Prüfungsberechtigt) Roeper, Julia (Prüfungsberechtigt) Dübbel, Lena (Prüfungsberechtigt) Loser, Karin (Prüfungsberechtigt) Mykicki, Nadine (Prüfungsberechtigt) Dübbel, Lena (Module counselling) Roeper, Julia (Module counselling) |
| Prerequisites | Enrolment in Master's programme Molecular Biomedicine |
| Skills to be acquired in this module | Goals of the Module: Upon successful completion of this module, students - can define and identify oncogenes and tumor suppressor genes - know about the hallmarks of cancer and can explain them based on example pathways and traits - know about the complexity of the tumor tissue and the different cells that are involved - know about the principles of metastasis. |
| | Competencies: ++ deepened biological & clinical expertise ++ interdisciplinary thinking + deepened knowledge of biological working methods & clinical diagnostics ++ data analysis skills + usage of databases and computational tools ++ critical & analytical thinking + independent searching & knowledge of scientific literature ++ data presentation & discussion (written and spoken) + teamwork ++ ethics & professional behavior |
| Module contents | Part 1 - Lecture: We will give a brief overview of several aspects of tumor biology: Types of mutation, hallmarks of cancer, tumor as a tissue, metastasis, oncogenes and tumor suppressor genes, signal transduction and many example pathways tha are important for cancer progression. In addition, you will learn about tumor-infiltrating immune cells and new therapy options like tumor-immune therapy. Part 2 - Seminar: |
| | Students will be expected to demonstrate the ability to prepare presentations in small working groups where they critically evaluate current research regarding specific examples of tumor diseases and their therapy (problem-orientated learning) Optional: Lectures from the study programme Human Medicine (winter semester only; will be held in German): Lecture topics from the human Medicine programme focusses on large tumor entites, therapy strategies, and basics of carcinogenesis and therapetic implementation. Please note, that these lectures are not part of the curriculum and are therefore not relevant for the examinations. |
| Literaturempfehlungen | Current literature will be uploaded on Stud.IP. Previous literature research is not necessary. If you are looking for more information/background: Weinberg; "The Biology of Cancer"; Garland Science |

| Prerequisites | none | |
| Skills to be acquired in this module | ++ Expt. Methods + Independent Research + Scient. Literature ++ Social skills ++ Interdiscipl. knowlg + Scientific English ++ Ethics Upon successful completion of this course, students know the relevant EU legislation governing animal welfare and are able to explain its meaning in common language understand and are able to critically discuss salient ethical concepts in animal experimentation, such as the three Rs and humane endpoint. have basic knowledge of the biology and husbandry of laboratory animal species held at the University of Oldenburg (rodents or birds or fish) are able to critically assess the needs and welfare of animals without compromising scientific integrity of the investigation have practical skills in handling small rodents or birds or fish have practical skills in the analysis and basic principles of surgery. have practised invasive procedures and euthanasia. NOTE: These objectives aim to satisfy the requirements for EU directive A "Persons carrying out animal experiments" and EU directive D "Persons killing animals". | |
| Module contents | Background knowledge is taught using the third-party online platform "LAS Interactive" which concludes with a written exam that has to be passed before the practical part. Topics covered are: Legislation, ethics and the 3Rs Scientific integrity Data collection " Basic biology of rodents, birds and fish Husbandry, and nutrition of rodents, birds and fish Animal Welfare Health monitoring Pain and distress Euthanasia | |

Practical procedures will first be demonstrated, important aspects will then be practiced under supervision by every partipant, on an animal model of their choice (rodents, birds or fish):

- Handling and external examination
 Administration of substances, blood sampling
 Euthanasia and dissection
 Transcardial perfusion
 Anaesthesia and surgery

| Verwendbarkeit des Moduls | Master's Programme Molecular Biomedicine (Master) > Skills Modules |
| Zuständige Personen | Helgers, Simeon (module responsibility) Dömer, Patrick (Prüfungsberechtigt) Helgers, Simeon (Prüfungsberechtigt) |
| Prerequisites | Enrolment in Master's programme Molecular Biomedicine |
| Skills to be acquired in this module | Goals of this module: Upon successful completion of this module, students are familiar with the basic principles of academic practice including academic writing, data analysis, data presentation and general rules regarding ethics and laws. Skills to be acquired/ competencies: ++ independent searching and knowledge of scientific literature ++ ethics and professional behavior ++ data presentation and discussion (written and spoken) ++ data analysis skills + deepened knowledge of biological working methods + critical and analytical thinking + interdisciplinary thinking + teamwork |
| Module contents | The module focuses on the basic principles of academic practice. In theoretical and practical parts, the students will learn how to structure and write protocols, articles, and thesis. be introduced to general guidelines, plagiarism, national and international guidelines and good scientific practice. learn how to manage, analyze, and present data sets in written and spoken form. learn to work with scientific images/plots etc. be introduced to application writing (ethic approvals, grand applications etc.) learn about authorship and the process of publications. The module will consist of lectures and practical parts consisting of lab work, data analysis and writing assignments. |
