### Verwendbarkeit des Moduls

- Master's Programme Business Informatics (Master) > Akzentsetzungsmodule der Informatik
- Master's Programme Computing Science (Master) > Technische Informatik
- Master's programme Digitalised Energy Systems (Master) > Digitalised Energy System Design and Assessment
- Master's Programme Engineering of Socio-Technical Systems (Master) > Embedded Brain Computer Interaction
- Master's Programme Engineering of Socio-Technical Systems (Master) > Systems Engineering

### Zuständige Personen

- Rauh, Andreas (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

### Prerequisites

Basic knowledge of the control of linear time-continuous and/or time-discrete systems and/or robust control

### Skills to be acquired in this module

The students identify fundamentals of uncertainty modelling in control systems as well as problem-specific methods for the consideration of uncertainty during simulation and observer synthesis.

**Professional competences**

The students:

- identify fundamentals of uncertainty modeling in control systems
- characterize problem-specific solution techniques for systems with stochastic and set-based uncertainty
- are aware of software implementations in simulation, control, and state estimation.

**Methodological competences**

The students:

- students identify fundamentals of uncertainty modelling in control systems
- characterise problem-specific solution techniques for systems with stochastic and set-based uncertainty
- are aware of software implementations in simulation, control, and state estimation.

**Social competences**

The students:

- analyse problems of control-oriented uncertainty modelling
- analyse fundamental solution techniques on a theoretical basis as well as transfer and generalise them independently toward novel research-oriented application scenarios.

**Self competences**

The students:

- critically reflect the achieved results of their project work
- acknowledge limitations of various approaches for a control-oriented uncertainty modeling.

### Module contents

1. Mathematical modeling of uncertainty in linear and nonlinear dynamic systems
2. Stochastic modeling approaches
Probability distributions
Bayesian state estimation for discrete-time systems
(linear/nonlinear) and for continuous-time systems (linear)
Linear estimation techniques in an extended state-space
(Carleman linearization for special system classes)
Monte-Carlo methods
3. Estimation of states, parameters and simulation of uncertain processes
Outlook: Markov models
Outlook: Bayesian networks
4. Set-based approaches
Set-based algorithms: Forward-backward contractor and
bisection techniques
Interval methods for a verified solution of ordinary differential
equations and for a stability proof of uncertain systems
Estimation of states and parameters as well as simulation of
uncertain processes
5. Outlook: Synthesis of controllers and state observers under an explicit
description of uncertainty

**Verwendbarkeit des Moduls**
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's programme Digitalised Energy Systems (Master) > Digitalised Energy System Design and Assessment

**Zuständige Personen**
- Bremer, Jörg (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

**Prerequisites**
- Programming mit Python, Simulation-based Smart Grid Engineering and Assessment

**Skills to be acquired in this module**
Successfully completing this lecture will enable the students to mathematically model simple controllable electrical generators and consumers and to simulate them together with appropriate control algorithms within smart grid scenarios. To achieve this goal, student will start with deriving computational models from physical models and by evaluating them. In order to manage the integration of control algorithms. Students are taught the principles of cosimulation using the example of the *mosaik* smart grid cosimulation framework. Students are put into the position to understand and apply distributed, agent-based control schemes to decentralised energy generators and/or consumers. As a result, students are able to analyze the requirements for successful application to real power balancing regarding capacity utilization, robustness, and flexibility. In addition, students practically apply the foundations for planning and conducting simulation based experiments as well as the interpretation of the results. Attention is especially paid to a tradeoff between precision and robustness of the results and the necessary efforts (design of experiments) in order to gain as much insight into interdependencies with as few experiments.

**Professional competence**
The student:
- derive and evaluate computational models from physical models
- use the *mosaik* smart grid cosimulation framework
- analyze the requirements for successful application to real power balancing regarding capacity utilization, robustness, and flexibility
- name the foundations for planning and conducting simulation based experiments as well as the interpretation of the results
- are aware to the tradeoff between precision and robustness of the results and the necessary efforts (design of experiments) in order to gain as much insight into interdependencies with as few experiments.

**Methodological competence**
The student:
- model simple controllable electrical generators and consumers
- simulate simple controllable electrical generators and consumers with appropriate control algorithms within smart grid scenarios
- apply distributed agent-based control schemes to decentralised energy generators and/or consumers
- evaluate simulation results
- search information and look into methods to implement models
- propose hyphothesis and check their validity with simulation experiments

**Social competence**
The student:
- apply the development technique pair programming
- discuss design decisions
- identify work packages and take responsibility for it

**Self-competence**
The student:
- reflect on their own use of the limited resource power
- accept and use criticism to develop their own behaviour

**Module contents**
In this practical course students:
• mathematically model controllable, modulating electrical energy generators and consumers and translate them to executable simulation models,
• put hands on mosaic (installation, description and configuration of scenarios, conduction of simulations),
• learn the principles of co-simulation of energy systems,
• learn about the challenges of implementing coordination mechanisms (multi-criticality, convergency, quality) on the training,
• apply foundations of design of experiments to practical simulation based experiments.

- Lehrenden, Die im Modul (Prüfungsberechtigt)

**Prerequisites**
Basic knowledge of the control of linear continuous-time and/or discrete-time systems or of robust control

**Skills to be acquired in this module**
The students identify fundamentals of robust control and state estimation as well as problem-specific solution techniques and their corresponding software implementation.

**Professional competences**
The students
- identify fundamentals of robust control and state estimation
- characterize problem-specific solution techniques for different classes of uncertainty
- are aware of reliable software implementations.

**Methodological competences**
The students
- analyze problems of robust control and state estimation for dynamic systems
- analyze fundamental solution techniques on a theoretical basis
- transfer as well as generalize those independently to new fields of applications.

**Social competences**
The students
- develop solution ideas for real-life control problems within an accompanying project in small teams
- explain the obtained results in short presentations.

**Self competences**
The students
- critically reflect the achieved results of their project work
- acknowledge limitations of various approaches for robust control and state estimation.

**Module contents**

1. Robustness of linear systems/ system analysis
   - Boundary crossing theorem of Frazer and Duncan
   - Mikhailov criterion
   - Khantinov criterion
   - Frequency response approaches

2. Selected control design techniques/ control synthesis
   - Parameter-space approach of Ackermann and Kaebsbauer
   - Eigenvalue and eigenvalue domain assignment
H-infinity control
- Frequency response approaches (Sensitivity function approaches in the frequency domain)

3. Robust LMI-based control techniques
- Lyapunov stability
- Polytopic uncertainty modeling
- Optimality of solutions

4. Duality between control and observer synthesis
- Robust state estimation
- Sliding mode observers

5. Interval methods: Solution of static and dynamic problems (Enclosing function values, Branch-and-bound techniques, Verification techniques for differential equations)

6. Fundamentals: Fault detection and fault-tolerant control

Präsenzzeit Modul insgesamt: 42 h
After successful completion of the course the students should be able to understand the existing structures and technical basis of energy systems to produce, transfer and distribute electricity and their interaction and dependency on each other. They should have developed an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems. The students are able to estimate and evaluate the requirements and challenges of ICT and computer science which are caused by the development and integration of unforeseeable fluctuations of decentralised plants.

The students will be able to estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems. Regarding the requirements, the students will be able to analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems.

**Professional competence**

The students:

- understand the existing structures and the technical basis of energy systems producing, transferring and distributing electricity and their interaction and dependency on each other.
- develop an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems.
- estimate and evaluate the requirements and challenges of ICT and computer science, which are caused by the development, and integration of unforeseeable fluctuations of decentralised plants.
- estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems.

**Methodological competence**

The students:

- analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems.
- use advanced mathematical methods to calculate networks.

**Social competence**

The students:

- create solutions in small teams.
- discuss their solutions.

**Self competence**

The students:

- reflect their own use of the limited resource power.

**Module contents**

In this course information technology, economical energy industry and technical basic knowledge and methods are analysed by using concrete Smart
Grid approaches. The basic calculation methods for an intelligent net management are introduced. This module deals with the technical and economical framework for a permissible electrical network as well as mathematical modelling and calculation methods to analyse conditions of electrical energy networks (in stationary conditions).

These are:

- the organisation of the EU energy market (regulatory framework, responsibility in liberalisation of electrical energy systems)
- Establishment and operation of electrical energy supply networks (network topology, statutory duties of supply, supply quality/system services, malfunctions and protection systems)
- Intelligent network management (Smart Grids), Aggregation forms, machine learning approaches)

Zuständige Personen
- Lehnhoff, Sebastian (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
No participant requirements

Skills to be acquired in this module
- The students will learn different approaches to integrate distributed generation, the regulatory framework, relevant standards and architecture concepts of energy management systems and they are able to apply this knowledge.

Professional competence
- The students:
  - develop and evaluate IT- Architectures for energy management
  - model objects of this domain appropriately
  - model energy information systems
  - realise and differentiate advanced tasks of decentralised energy management

Methodological competence
- The students:
  - name problems for the energy management, analyse these problems systematically and provide solutions
  - apply different simulation approaches of decentralised plants and consumers

Social competence
- The students:
  - discuss solutions for the energy management together
  - develop use cases in teams
  - present self-developed solutions

Self competence
- The students:
  - reflect their actions with regard to structure and decompose systems
  - reflect their own use of the limited resource power

Module contents

This module provides the computer science basics for the energy management. It provides the requirements of energy supply information systems with the focus on technical components and the requirements of decentralised and renewable energy plants.

These are:
- Architectures for energy information systems, e.g. SOA, Seamless Integration Architecture (IEC TC 57), OPC-UA
- Norms and standards of energy industry data models (CIM, 61850)
- Systematisation of energy information system requirements based on ontologies
- Development, analysis and adaption of energy industry reference models and processes
- Methods and technologies to support energy industry processes
- Methods and algorithms to support decision processes of the decentralised energy plants control
- Smart Grid plants communication, the load management in particular
- Methods for modelling and simulation of power supply system dynamics

Präsenzzeit Modul insgesamt 56 h
inf516 - Distributed Operation in Digitalised Energy Systems

Module contents

In this course, fundamentals of agent-based control with applications in cyber-physical power systems are reviewed, discussed, and reinforced in the accompanying programming exercise.

These are:

1. Multi-agent systems
   - Foundations and definitions
   - MAS architectures
   - Agent communication
   - Cooperative and competitive agents MAS
   - Learning in MAS
2. Distributed Optimization
   - CASIMIR
   - Overview on distributed optimization
   - CSP and COP
   - Distributed SCP and COP
3. Self-organizing energy systems
4. Applications
Virtual Power Plants
- QEMS and Microgrids
- DSM and DR
- Energy market applications
- Swarms for storage management
- Multi-purpose examples

5. Programming part
- Agent framework mango
- Co-simulation framework mosaik
- Power grid simulation pandapower

Verwendbarkeit des Moduls
- Master's programme Digitalised Energy Systems (Master) > Digitalised Energy System Automation, Control and Optimisation

Zuständige Personen
- Nieße, Astrid (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
No participant requirements

Skills to be acquired in this module
This module integrates current developments in the field of Digitalised Energy Systems in adequate study courses.

Professional competences
The students:
- define and contrast a computer science part, in which they are specialised, in detail or
- evaluate computer science in general
- recognise and evaluate applied techniques and methods of their subject and are aware of their limits
- identify, structure and solve problems/tasks, also in new or developing subject areas
- apply state of the art and innovative methods to solve problems, if necessary from other disciplines
- are aware of the current limits and contribute to the development of computer science research and technology discuss
- evaluate recent computer science developments

Methodological competences
The students:
- evaluate and apply tools technology and methods
- sophisticatedly combine new and original approaches and methods
- creatively evaluate problems/tasks, including new or developing subject areas of their discipline
- apply computer science methods for solutions and research

Social competences
The students:
- support team process by their abilities

Self competences
The students:
- pursue the overall and special computer science development critically
- implement innovative professional activities effectively and independently

inf5100

Credit points
6.0 KP

Workload
180 h

Verwendbarkeit des Moduls
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's programme Digitalised Energy Systems (Master) > Automation and Electrical Engineering

Zuständige Personen
- Staudt, Philipp (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
No participant requirements

Skills to be acquired in this module
This module integrates current computer science developments into the informatics program, especially considering the selected focus area, by appropriate study courses

Professional competence
The students:
- will be able to follow scientific work in the application area of digitalised energy markets, and thus be able to reflect on the current state of research in this area

Methodological competence
The students:
- are able to classify energy markets and judge new technological developments based on this classification

Social competence
The students:
- create solutions in small teams
- present and discuss their solutions
- reflect the solutions of others in a constructive manner

Self competence
The students:
- evaluate new technologies regarding their relevance for current energy-economic topics.

Module contents

In this module, theoretical concepts for understanding energy markets are presented and reflected with respect to the questions, how digitalisation of cyber-physical energy systems (CPES) is impacting the development of these markets. Fundamental concepts are discussed using easy-to-follow examples. These are:

- Overview on Energy Markets
- Consecutive markets and different time horizons
- Smart Grids and energy markets
- Push-effect of digital technologies on energy market development
- Digitalised processes on energy markets
- Market integration of renewable energy resources

Verwendbarkeit des Moduls
- Master's programme Digitalised Energy Systems (Master) > Automation and Electrical Engineering

Zuständige Personen
- Gawlik, Wolfgang (module responsibility)
- Lehrenden, Die im Modul (module responsibility)

Prerequisites
- No participant requirements

Skills to be acquired in this module

Professional competence
The students:
- can describe components of electrical energy systems and understand their mutual interactions and dependencies in a systemic context.

Methodological competence
The students:
- can model components of the electrical energy system and perform calculations to determine the model parameters and using the model parameters and model properties
- can analyze operating processes, operating states and faults in the electrical energy system and identify mutual interactions
- can dimension operating resources in a systemic context

Social competence
The students:
- can explain the components of electrical energy systems to each other and jointly discuss solutions for typical operating processes and problems in electrical energy systems
- can work together on problems and challenges of the electrical energy system across subjects and disciplines.

Self competence
The students:
- are able to critically reflect on the requirements for components of electrical energy systems and to assess their importance for system operation within the systemic context.

Module contents

Power System Components
- Lines, transformers and rotating electrical machines
- Power electronics and FACTS
- Switchgear and substations
- Network structures, AC and DC systems
- Power plants and distributed generation
- Energy storage and sector coupling

Power System Operation
- Load flow, short circuits and protection
- Interconnected power systems and Microgrids
- Active power and load/frequency control
- Reactive power and voltage control
- Emergency operation and network restoration

Verwendbarkeit des Moduls

- Master's programme Digitalised Energy Systems (Master) > Automation and Electrical Engineering

Zuständige Personen

- Lehrende, Die im Modul (module responsibility)
- Rauh, Andreas (module responsibility)

Prerequisites

It is recommended to take the Research Project only after having completed the other modules of the two areas "Foundations of Digitised Energy Systems" and "Fundamental Competences"

Skills to be acquired in this module

- The students identify fundamental research concepts of modelling, control, state estimation, simulation, and optimisation of digitalised energy systems

Professional competence

- identify fundamental concepts for design and operation of digitalised energy systems
- characterise different solution approaches
- recognise the implementation of selected aspects such as simulation and optimisation

Methodological competence

- develop solution ideas in a research-oriented environment.

Social competence

- develop solution ideas in small project teams of typically 3 persons, document their results in written form, and explain the obtained results in short presentations

Self competence

- critically reflect the achieved results of their project and acknowledge limitations of approaches used.

Module contents

- Project work in teams of students on the basis of current subject proposals made by all teaching staff of DES
- Fundamental literature review
- Independent derivation of research questions
- Implementation and validation of solution approaches

Computer Science and Energy Informatics

inf5104 - Fundamentals of Game Theory in Energy Systems

Module label
Fundamentals of Game Theory in Energy Systems

Modulkürzel
inf5104

Credit points
6.0 KP

Workload
180 h

Verwendbarkeit des Moduls
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's programme Digitalised Energy Systems (Master) > Computer Science and Energy Informatics

Zuständige Personen
- Nieße, Astrid (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
Useful prior knowledge: Fundamentals of optimization

Skills to be acquired in this module

Upon successful completion of the course, students can understand fundamental concepts of game theory, and the relevance of these concepts to applications in energy informatics research.

Professional competence
The students:
- will be able to follow game-theoretic work in the application area of energy systems, and thus be able to reflect on the current state of research in this area

Methodological competence
The students:
- can classify and formalise games and apply solution concepts for the presented types of games. Application examples can be examined for game types and the necessary simplifications can be evaluated.

Social competence
The students:
- create solutions in small teams
- present and discuss their solutions
- reflect the solutions of others in a constructive manner

Self competence
The students:
- derive connections between everyday situations and their game theory conceptualization.

Module contents

In this module, theoretical concepts from game theory are prepared and presented with connections to the application in cyber-physical energy systems (CPES).

Fundamental concepts are discussed using easy-to-follow examples.

These are:
- Game theory and decision theory
- Interdependencies
- Cooperative and non-cooperative game theory
- Utility, discrete and continuous strategy, dominant strategy
- Axioms of game theory
- Theorems of game theory
- Solution concepts for games, e.g. iterated elimination, backward induction
- Multi-step and repeated games
- Partial game perfection
- Discount factor
- Mechanisms design, markets and auctions

In CPES-application examples, references are made to distributed artificial intelligence and multi-agent systems, strategy learning, and operating in markets in energy applications.

inf5106 - Optimal and Model-Predictive Control

Module label: Optimal and Model-Predictive Control
Modulkürzel: inf5106
Credit points: 6.0 KP
Workload: 180 h

Verwendbarkeit des Moduls
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's programme Digitalised Energy Systems (Master) > Computer Science and Energy Informatics

Zuständige Personen
- Rauh, Andreas (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
Useful previous knowledge: Basic knowledge of control of linear continuous-time and/or discrete-time systems or robust control.

Skills to be acquired in this module
The students identify fundamentals of the optimisation of control systems

Professional competence
The students:
- identify fundamentals of the optimisation of control systems
- characterise static and dynamic optimisation problems
- are aware of software implementations for selected test rigs

Methodological competence
The students:
- analyse problems of optimal control
- generalise them independently toward novel research-oriented application scenarios

Social competence
The students:
- develop solution ideas for real control engineering tasks in small groups in a project/practical course accompanying the lecture
- communicate their results in short presentations

Self competence
The students:
- critically reflect the achieved results of their project work
- acknowledge limitations of various approaches for optimal control design

Module contents
1. Parameter optimization
   - Unconstrained optimisation
   - Optimisation under equality/inequality constraints
2. Dynamic optimisation (structural optimisation)
   - Bellman’s optimality principle
   - Maximum principle of Pontryagin
   - Special optimisation problems: Minimum time problems, minimum energy, LQR
3. Linear model-predictive control
4. Nonlinear model-predictive control
5. Receding horizon state estimation

### Präsentzeit Modul insgesamt

56 h
inf5110 - Practical Course (Energy Informatics)

**Module label**
Practical Course (Energy Informatics)

**Modulkürzel**
inf5110

**Credit points**
15.0 KP

**Workload**
450 h

**Verwendbarkeit des Moduls**
- Master's programme Digitalised Energy Systems (Master) > Computer Science and Energy Informatics

**Zuständige Personen**
- Lehnhoff, Sebastian (module responsibility)
- Rauh, Andreas (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

**Prerequisites**
MATLAB/Simulink, programming basics in Java or Python, development on embedded systems

**Skills to be acquired in this module**
The aim of the module is to impart practical competences required in energy informatics for the implementation of control and regulation approaches in the field on plants and in the grid.

**Professional competence**
The students:
- know basic modelling approaches for components in power systems.
- know procedures for parameter identification
- know linear and non-linear methods for closed-loop and optimised control of technical systems
- know basic procedures for dealing with faults and technical malfunctions in control systems
- know the challenges of implementing control approaches on resource-constrained engineered systems in the field

**Methological competence**
The students:
- select appropriate modelling approaches
- apply methods for parameter identification
- apply methods for the control of technical operating parameters
- implement these approaches on a (virtual) embedded system

**Social competence**
The students:
- discuss the model selection used approaches in the team
- present and discuss results with other students

**Self competence**
The students:
- reflect on the abstract modelling of complex technical systems and processes
- reflect on problems and uncertainties and errors
- recognise the limitations of embedded systems in the field
- accept criticism and understand it as a suggestion for the further development of their own actions

**Module contents**

**Modelling of components in DES**
- Battery cells (equivalent circuit modelling, thermal model)
- Step-down converter circuits
- Electric drive systems (modelling of complete drive train, including mechanics)

**Parameter identification in DES**
- Design of identification experiments
- Parameter optimisation (time domain/ frequency domain, impedance spectroscopy)
- Design of state observers and (Extended) Kalman Filters
- Linear Control
- Output feedback control of electric drive train (PID)
including anti-windup)
- Observer-based state feedback control
- Disturbance estimation and compensation

Nonlinear control/ Variable-structure control
- Lyapunov methods for control design
- Flatness-based control techniques
- Robustness analysis
- Real-time implementation of methods for chattering reduction

Optimal control/ MPC
- Charging under state constraints
- Energy optimal battery charging
- Minimum-time solutions
- State of charge equalization
- Thermal state constraints

Fault detection and isolation
- Sensor vs. actuator faults
- Observer-based approaches for inverter circuits
- Observer-based approaches for drive trains
- Fault-tolerant control structures, control reconfiguration

Implementation Studies
- Implementation of a controller on practically relevant hardware (vRTU/vIED programming of a network or plant controller)
- Hardware-in-the-loop simulation of the controller (Simulink modelling of the RT environment and compilation on the RT target)

Literaturempfehlungen
Will be announced in the course

<td>Goal of this module is to teach mathematical and methodological foundations of energy informatics and for conducting large-scale simulation studies</td>
</tr>
</tbody>
</table>

**Professional competence**
The students:

- know methods to analyze black-box objective functions
- recognize the relation between precision and reliability of expected results and the necessary surplus effort
- know methods to determine cause-effect relations between input parameters with small numbers of simulations (experiments)
- evaluate the significance of simulation results
- characterize (distributed) algorithms by their properties
- transfer proving techniques to distributed problems

**Methodological competence**
The students:

- choose suitable statistical methods to interpret simulation results
- apply methods from design of experiments
- apply significance tests to compare algorithms
- generate arbitrarily distributed input data
- present results from algorithm evaluation statistically sound

**Social competence**
The students:

- discuss the own algorithm choice
- present their results and discuss with other students

**Self-competence**
The students:

- reflect their own usage of the scarce resource energy
- reflect problems and uncertainties when using statistical methods
- recognize the limits of simulation studies and their responsibility for choosing correct statistical methods
- accept criticism and understand it as a suggestion for the further development of their own actions

Verwendbarkeit des Moduls
- Master's Programme Computing Science (Master) > Angewandte Informatik
- Master's programme Digitalised Energy Systems (Master) > Innovation Topics and Smart Grids

Zuständige Personen
- Lehnhoff, Sebastian (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
- No participant requirements

Skills to be acquired in this module
- This module integrates current developments in cyber resilience and its application to energy systems.

Professional competences
- The students
  - recognise the entailed problems and challenges of new digitalization trends such as billion devices on the internet connected to our power grid (televisions, baby monitors, alexa, etc.), smart services, cloud services, outsourcing, Artificial Intelligence, Big Data etc.
  - evaluate fraud/intrusion detection methods
  - identify security flaws and vulnerabilities of the energy system

Methodological competences
- The students
  - examine tasks with technical and research literature, write an academic article and present their solutions academically
  - evaluate problems of cyber resilience in energy systems
  - schedule time processes and resources.

Social competences
- The students
  - communicate with colleagues and experts convincingly.

Self competences
- The students
  - reflect the problems of cyber resilience of energy systems critically and pursue different possible solution strategies.
  - reflect self-developed hypotheses and theories independently.

Module contents
- Energy system as critical infrastructure (KRITIS)
- Propagation of phenomena and their dynamics
- Omnipresent conflicts of objectives
- Susceptibility of the energy system to new effects, such as the occurrence of "classic" IT challenges (errors, update management, interactions, …) and to sophisticated cyber-attacks

Literaturempfehlungen
- Will be announced in the course

**Zuständige Personen**
- Bremer, Jörg (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

**Prerequisites**
No participant requirements

**Skills to be acquired in this module**
The students learn to understand the energy system as self-organizing, self-optimizing and self-healing cyber physical system and how equip the components with of a cyber physical energy system with intelligence and autonomy.

**Professional competences**
The students
- contrast different methods of AI
- define modern use cases of AI applications in energy systems
- identify appropriate AI methods to achieve a given control goal in the energy system
- evaluate risks and drawbacks of AI in energy systems
- apply AI to selected problems

**Methological competences**
The students
- examine tasks with technical and research literature, write an academic article and present their solutions academically
- evaluate problems of AI in energy systems
- schedule time processes and resources

**Social competences**
The students
- communicate with colleagues and experts convincingly

**Self competences**
The students
- pursue and reflect the integration of AI into energy systems critically
- reflect self-developed hypotheses to theories independently

### Module Contents

- Simulation (and prediction) of human behaviour and decisions
- Modeling user behaviour in human cyber physical systems
- Self-explaining and justifying AI

### Skills to be acquired in this module

**Professional competences**

- recognise the energy system as a human cyber physical system with a steadily growing degree of autonomy
- identify the potential for conflict that arises when humans interact with cyber physical systems
- model human-system-interaction
- recognise, evaluate and contrast approaches to self-explaining AI

**Methodological competences**

- examine tasks with technical and research literature, write an academic article and present their solutions academically
- evaluate problems of socio-technical energy system
- schedule time processes and resources

**Social competences**

- communicate with colleagues and experts convincingly

**Self competences**

- pursue the integration of humans and human behaviour into cyber physical energy systems critically
- develop and reflect self-developed hypotheses to theories independently

### Skills to be acquired in this module

**Professional competences**

- Define and contrast a computer science part, in which they are specialised, in detail or evaluate computer science in general.
- Recognise and evaluate applied techniques and methods of their subject and be aware of their limits.
- Identify, structure and solve problems/tasks, also in new or developing subject areas.
- Apply state of the art and innovative methods to solve problems, if necessary from other disciplines.
- Be aware of the current limits and contribute to the development of computer science research and technology.
- Discuss and evaluate recent computer science developments.

**Methological competences**

- Examine tasks with technical and research literature, write an academic article and present their solutions academically.
- Evaluate problems/tasks, including new or developing subject areas of their discipline and apply computer science methods for solutions and research.
- Schedule time, processes and resources.

**Social competences**

- Communicate with users and experts convincingly.

**Self competences**

- Pursue the overall and special computer science development critically.
- Develop and reflect self-developed hypotheses to theories independently.

Verwendbarkeit des Moduls
- Master's programme Digitalised Energy Systems (Master) > Abschlussmodul

Zuständige Personen
- Lehnhoff, Sebastian (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites
- Modules of the study program that are thematically relevant for the topic of the Master's thesis

Skills to be acquired in this module

- The students prove that they are able to process and solve complex computer science tasks based on gained scientific knowledge and applied research methods. The students successfully implement a task especially by using their acquired professional and methodological knowledge and their professional and social competences.
- The accompanying seminar is used to discuss the master's thesis methodically and content-related. During the seminar the exchange of research and practical experience fosters the students' ability to discuss and evaluate their thesis with other students and experts.
- The master's thesis is finished by a colloquium

Professional competences
- The students:
  - recognise and evaluate applied techniques and methods of their subject and are aware of their limits
  - design solutions for complex, possibly vaguely defined or unusual computer science tasks/problems and evaluate these with reference to state of the art computer science and technology
  - identify, structure and solve problems/tasks, also in new or developing subject areas Apply state of the art and innovative methods to solve problems, if necessary from other disciplines
  - relate knowledge from different disciplines and apply this new knowledge in complex situations
  - develop complex computer systems, processes and datamodels
  - are aware of the current limits and contribute to the development of computer science research and technology
  - discuss and evaluate recent computer science developments

Methodological competences
- The students:
  - identify and develop one or more solutions Evaluate and apply tools, technology and methods sophisticatedly
  - examine tasks with technical and research literature, write an academic article and present their solutions academically
  - schedule processes and resources
  - apply project management techniques
  - combine new and original approaches and methods creatively
  - evaluate problems/tasks, including new or developing subject areas of their discipline and apply computer science methods for solutions and research

Social competences
- The students:
  - communicate with users and experts convincingly
  - make reasonable decisions

Self-competences
- The students:
  - pursue the overall and special computer science development critically
  - implement innovative professional activities effectively and independently
  - recognise their abilities and extend them purposefully
  - reflect their self-perception and actions with regard to professional,
**methodological and social aspects**

- develop and reflect self-developed hypotheses to theories independently
- work in their field independently
