<b>Prerequisites</b>	- Simultaneous hearing of Mechanics & Electrodynamics and Optics lectures - Course I is a prerequisite for course II
<b>Skills to be acquired in this module</b>	Students will learn the basics of physical experimentation, the use of modern instrumentation, data collection and analysis using appropriate hardware and software. They deepen lecture material through their own experiments. They acquire the skills for planning, implementation, evaluation, analysis, and reporting of physical experiments and presenting of results using multimedia tools. By working in groups, they gain competencies in the areas of teamwork and communication.
<b>Module contents</b>	Introduction to software for scientific data analysis, analysis and assessment of measurement uncertainties, analysis and verification of measured data, fitting of functions to measured data, dealing with modern measurement techniques, carrying out experiments in the fields of mechanics, electricity, optics, nuclear radiation, electronics, signal acquisition, signal processing.

<b>Module label</b>	Quantum Structure of Matter
<b>Modulkürzel</b>	phy551
<b>Credit points</b>	6.0 KP
<b>Workload</b>	180 h ( Attendance: 56 hrs Self study: 124 hrs )
<b>Verwendbarkeit des Moduls</b>	<ul style="list-style-type: none"> <li>Bachelor's Programme Engineering Physics (Bachelor) &gt; Aufbaumodule</li> </ul>

<b>Prerequisites</b>	Mechanics, Electrodynamics and Optics, Atomic and Molecular Physics, Mathematical Methods for Physics and Engineering I-III. These courses are mandatory prerequisites.
<b>Skills to be acquired in this module</b>	The students will gain knowledge of the fundamental principles of quantum mechanics and their application to the modelling of the equilibrium structure of different atomic, molecular and solid state material systems. The course will enhance their competence to understand and apply basic theoretical concepts in quantum mechanics. The students will learn how to rationalize quantum effects and wave phenomena in a variety of material systems and will become acquainted with strategies how to explain the equilibrium steady-state structure of different types of matter. The students will also be introduced into the nonequilibrium dynamics of selected quantum systems.
<b>Module contents</b>	<p>The course aims at providing a modern introduction into quantum mechanical foundations of the structure of atomic, molecular and solid state systems. It will bridge the gap between „Atomic and Molecular Physics“ and „Solid State Physics.“ The following content will be covered:</p> <ol style="list-style-type: none"> <li>1. Introduction into quantum mechanics</li> <li>2. Quantum theory: techniques and applications</li> <li>3. Atomic and molecular structure</li> <li>4. Light-matter interaction</li> <li>5. Molecular spectroscopy</li> <li>6. Introduction into quantum dynamics</li> <li>7. Molecular reaction dynamics</li> <li>8. Macromolecules and Aggregates</li> <li>9. Solid State Materials</li> </ol> <p>The course will be held at the level of an advanced course in physical chemistry and requires basic knowledge of quantum mechanics as introduced in "Atomic and Molecular Physics".</p>

<b>Prerequisites</b>	Course Mathematical Methods II passed with a grade of at least 4.0.
<b>Skills to be acquired in this module</b>	Students acquire theoretical knowledge of basic numerical methods and practical skills to apply these methods to physical problems within all areas of experimental, theoretical and applied physics.
<b>Module contents</b>	Basic concepts of numerical Mathematics are introduced and applied to Physics problems. Topics include: Finite number representation and numerical errors, linear and nonlinear systems of equations, numerical differentiation and integration, function minimization and model fitting, discrete Fourier analysis, ordinary and partial differential equations. The learned numerical methods will be partly implemented (programmed) and applied to basic problems from mechanics, electrodynamics, etc. in the exercises. The problems are chosen so that analytical solutions are available in most cases. In this way, the quality of the numerical methods can be assessed by comparing numerical and analytical solutions. Programming will be done in C or, preferably, in Matlab, which is a powerful package for numerical computing. Matlab offers easy, portable programming, comfortable visualization tools and already implements most of the numerical methods introduced in this course. These built-in functions can be compared to own implementations or used in the exercises in some cases when own implementations are too costly. The tutorials provide basic programming support.

<b>Prerequisites</b>	Experimental Physics I-IV, Quantum structure of Matter			
<b>Skills to be acquired in this module</b>	The students gain comprehensive insights into solid state physics and associated phenomena. They learn how symmetry operations are interconnected with structural parameters of solids. From the chemical interaction between atoms, the binding properties and thermodynamic stability of solids are derived. The oscillatory motion of atoms in simple 1D chain models is extended towards the dynamic response of crystals, while a statistical analysis leads to the concept of heat capacity and heat conductance of solids. The quantum mechanical description of particles in a box is exploited to develop the model of free and quasi-free electrons as well as the band structure of solids. The students are made familiar with the economically relevant fields of semiconductor and low temperature physics as well as magnetism.			
<b>Module contents</b>	Crystal structures and symmetries, Bravais lattices, Reciprocal lattice and translational symmetry, Brillouin zone, Binding principles in solids (covalent, ionic, metallic, van-der Waals and hydrogen bonding), Dynamic properties of solids, Phonons, Atomic chain models, Dispersion relation, Specific heat, Heat conductance, Electrons in solids, Model of free and quasi-free electrons, State density, Fermi energy, Electrons in periodic potentials, Bloch theorem, Band model of electrons, Effective mass, Band gap, Occupation numbers, Semiconductors, Doping, Dielectric properties, Magnetic properties, Dia-, para- and ferro magnetism, Superconductivity

<b>Prerequisites</b>	
<b>Skills to be acquired in this module</b>	The students will learn basic principles of measurement technology and signal processing as well as the application of complex measurement methods to extract the measurement information. They will acquire skills to carry out advanced internships and experimental work in research laboratories. Further, they will develop the competence for analytical thinking in the evaluation of measurement situations, which will enable them to solve measurement problems such as those encountered in different branches of industry (e.g. automotive and semiconductor industries; analytical, pharmaceutical and medical industries).
<b>Module contents</b>	<p>Lecture Measurement Technology:</p> <p>Sensors for measuring different physical quantities (e.g. force, temperature, charge, electric and magnetic fields, energies of particles and radiation), high-resolution measurements of small signals, influence of interfering signals, linearization and reduction of interfering variables through compensation methods, noise reduction, phase-sensitive detector, complex measurement systems such as nuclear magnetic resonance, electron resonance, laser measurement technology (including pump / probe systems), spatially resolved measurement methods such as magnetic resonance tomography, electron and scanning probe microscopy.</p> <p>Lecture Signal Processing:</p> <p>Characterization and processing of measurement signals (linear signal analysis, filtering), characterization and elimination of interferences (empirical statistics, noise in physical systems, correlation analysis, phase-sensitive amplifiers, methods of averaging), signal digitization, digital signal processing</p> <p>Signal processing (including time-variant filtering, complex processing algorithms)</p> <p>Filterung, komplexe Verarbeitungsalgorithmen)</p>
<b>Literaturempfehlungen</b>	<p>SE Physikalische Messtechnik:</p> <p>Elmar Schrüfer, Elektrische Messtechnik: Messung elektrischer und nichtelektrischer Größen. Hanser Fachbuchverlag</p> <p>H.-R. **Prerequisites**

<b>Skills to be acquired in this module</b>	Students will apply their diversified scientific and professional skills to plan, prepare, organize and produce single-handed a research study.	
<b>Module contents</b>	The thesis comprises empirical, theoretical or experimental research and development according to the field of specialization	
<b>Literatureempfehlungen</b>	as required
