Basismodule

inf030 - Programming, Algorithms and Data Structures

Module label	Programming, Algorithms and Data Structures
Module code	inf030
Credit points	9.0 KP
Workload	270 h
Applicability of the module	<ul style="list-style-type: none"> • Bachelor's Programme Business Informatics (Bachelor) > Basiscurriculum • Bachelor's Programme Computing Science (Bachelor) > Basismodule • Bachelor's Programme Economics and Business Administration (Bachelor) > Studienrichtung Wirtschaftsinformatik • Bachelor's Programme Mathematics (Bachelor) > Nebenfachmodule • Bachelor's Programme Sustainability Economics (Bachelor) > Wahlpflichtbereich • Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Basismodule
Responsible persons	<p>Lehnhoff, Sebastian (Authorized examiners)</p> <p>Boles, Dietrich (Authorized examiners)</p> <p>Lehrenden, Die im Modul (Authorized examiners)</p>
Prerequisites	
Skills to be acquired in this module	

Programming is one of the basic activities of computer scientists and a prerequisite for many other courses in computer science studies. The aim of the module "Programming, Data Structures and Algorithms" is to learn the basic concepts of imperative, procedural and object-oriented programming using the Java programming language and to present known, efficient algorithms and data structures for various, frequently occurring problems.

After completing the module, the students should be able to independently develop imperative and simple object-oriented programmes based on Java for solving smaller problems and assess the efficiency of their programmes. They should also be able to apply important algorithms and select them based on their complexity.

****Professional competence****

The students:

- describe basic concepts of imperative programming with Java
- recognise imperative programming terminology and use the appropriate terms accurately in discussions
- recognise basic terminology of object-oriented programming
- describe what programs presented to them do
- independently develop programs to solve small problems
- systematically examine their own and other people's programmes for errors
- use modern programme development environments to develop and test programmes
- create algorithms with general design concepts (e.g. Greedy method, divide-and-conquer method)
- name algorithms and data structures for solving common problems and evaluate their applicability
- name problems of efficiency of algorithmic solutions of concrete problems and evaluate them
- make a well-founded choice of an algorithm and a data structure for solving a concrete problem
- apply the learned algorithms and data structures sensibly to given and concrete problems

****Methodological competence****

The students:

-
- solve given problems from the point of view of imperative or object-oriented programming
 - transfer practical experience in programme development to new tasks

****Social competence****

The students:

- communicate the structure and mode of operation of self-developed programmes to others
- present solutions to small tasks in front of groups

****Self-competence****

The students:

- organise themselves in finding algorithmic solutions to small and medium-sized problems in computer science
- incorporate the concepts of general programme design in their actions

Module contents

In the first part, general basic concepts of programming are introduced:

- Algorithm, programming languages, computer
- development tools, development phases
- compilers
- grammars
- logic

The second part deals with basic programming concepts:

- data types
- variables
- Expressions, statements
- control structures
- Methods, parameters
- recursion
- Reference data types, arrays
- Classes, objects
- Documentation
- Testing

The third part contains an introduction to data structures and algorithms as well as a discussion of their efficiency, i.e. the computational effort or memory requirements depending on the amount of data to be processed. The module introduces known, efficient algorithms and data structures for various, frequently occurring problems. These include in particular:

- Methods for searching for keys, as well as insertion and deletion in dynamic data sets, e.g. lists, trees, AVL trees or hash methods,
- Methods for searching for text patterns,
- Methods for sorting data by key values, e.g. QuickSort and HeapSort,
- Graph-based applications, e.g. for finding shortest paths in graphs.

The lecture part is supplemented by a comprehensive exercise part, in which in particular the taught programming contents are implemented in practical examples.

Reader's advisory

Essential:

Lecture Notes (made available either in printed form or via Stud.IP during the course of the lecture)

inf031 - Object-oriented Modelling and Programming

Module label	Object-oriented Modelling and Programming
Module code	inf031
Credit points	9.0 KP
Workload	270 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Business Informatics (Bachelor) > Basiscurriculum• Bachelor's Programme Computing Science (Bachelor) > Basismodule• Bachelor's Programme Economics and Business Administration (Bachelor) > Studienrichtung Wirtschaftsinformatik• Bachelor's Programme Mathematics (Bachelor) > Nebenfachmodule• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Basismodule
Responsible persons	Winter, Andreas (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners) Boles, Dietrich (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	

Object orientation represents the state of the art in software development today. Given problems are first transformed into an object-oriented model and then into an object-oriented program with the help of object-oriented analysis and design methods. Aim of the module "Object-Oriented Modelling and Programming" is to learn basic concepts of object-oriented modelling using UML as the modelling notation and object-oriented programming using the Java programming language. After completing the module, students should be able to independently develop object-oriented programs based on Java for solving medium-sized problems.

Professional competence:

The students:

- know basic concepts of object-oriented modelling and UML as modelling notation
- know basic concepts of object-oriented programming with Java
- know the terminology of object-oriented modelling and programming and use the appropriate terms precisely in discussions
- can describe what object-oriented programmes presented to them do
- independently develop models and programmes for solving medium-sized problems
- systematically examine their own and other people's models and programmes for errors
- use modern development environments for modelling and developing programmes
- know the differences between the imperative, object-oriented, functional, logical and rule-based programming paradigms

Methodological competence:

The students:

- independently develop programmes for given problems by consistently applying the concepts of object-oriented modelling and programming
- transfer practical experience in programme development to new tasks
- independently develop programmes with concurrency
- can independently apply known solution methods to complex problems

Social competence:

The students:

- communicate the structure and mode of action of self-developed models and programmes to others
- present independently developed solutions to groups

Self-competence:

The students:

-
- organise themselves when developing programmes for small and medium-sized problems in computer science
 - incorporate the concepts of object-oriented programme design in their actions

Module contents

In the first part, basic concepts of object-oriented modelling and programming are taught:

- Models and modelling
- UML class diagrams
- Classes and objects
- data encapsulation
- inheritance
- Polymorphism and dynamic binding
- Exception handling
- Genericity

In the second part, important concepts and classes of the JDK class library are introduced and the classes are used in solving medium-sized problems:

- Java Collection API
- IO and Streams
- GUI applications with JavaFX
- Parallel programming with threads

In the third part, advanced solution strategies are presented and other programming paradigms are introduced and compared with the object-oriented paradigm:

- Backtracking, Branch and Bound, Greedy
- Local Search, Evolutionary Algorithms
- Functional programming (e.g. Java-Lamdas, Standard ML)
- Logical programming (e.g. Prolog)
- Rule-based programming (e.g. Drools)

The lecture part is supplemented by a comprehensive exercise part, in which in particular the taught contents are implemented in practical examples.

Responsible persons	Winter, Andreas (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>The objective of the module is to convey the development and maintainance of large scale software systems. The complete software developing process including requirements collection, software architecture and quality control is observed. The basics of object oriented modelling and software development are enhanced.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• comprehend the different developmental phases of software (especially requirements engineering, software design, software implementation and quality control)• name the tasks of each phase• select appropriate methodical utilities• select suitable methods and utilities for each project phase• understand the advantages of the modelling process with UML• model moderate tasks in UML• understand and develop solutions for given problems by means of development environments <p>Methodological competence The students:</p> <ul style="list-style-type: none">• structure, document and evaluate problems and solutions with the tools of object oriented modelling• apply methods and techniques of object oriented modelling purposefully <p>Social competence The students:</p> <ul style="list-style-type: none">• create, present and discuss solutions with modelling techniques -• present and solve modelling problems in teams <p>Self-competence The students: reflect their problem-solving behaviour with regard to the capabilities of software technology</p>
Module contents	The module introduces fundamental terms and concepts in software engineering. This includes: - need for software engineering - activities and process-models in software development - object-oriented modelling, meta modelling - Interdependencies between code and models - requirements elicitation - definition of software architectures - application of software patterns - software quality management - software maintenance, evolution and operation Software engineering tools are presented and applied in practical exercises.

Responsible persons

Lehrenden, Die im Modul (Module counselling)

Grawunder, Marco (Module responsibility)

Prerequisites

Java Programmierkurs, Software Engineering , Algorithmen und Datenstrukturen

Skills to be acquired in this module

The students will be able to develop software iteratively in a team. This includes all stages of the software life cycle (requirements, analysis, design, implementation, test) and the presentation of the software development process. The students improve their Java skills.

Professional competence

The students:

- Apply software development techniques and methods and are aware of the techniques' limitations

Methodological competence

The students:

- Develop complex software with software engineering methods using a process-model and document these appropriately
- Make a rough schedule/estimate on tasks
- Implement an iterative process
- Familiarise themselves with unknown systems and frameworks
- Process complex tasks based on science and engineering and split them in subtasks
- Organise and implement small-scale projects
- Present and document the outcome of the project

Social competence

The students:

- Work in a team and solve conflicts
- Develop complex software in a team and assess the required efforts (time management)
- Reflect their self-performance and the performance of other students (review and retrospective)

Self-competence

The students:

- Improve their capacity for teamwork, in particular the ability to solve conflicts

Module contents

In a two-semester course a team of students develops a larger system. For this project a Scrum similar model is used. Typical external stakeholders/roles are represented by members of the team. Feedback is provided in regular presentations (two per semester with the lecturer, weekly in the seminars).

An accompanying lecture block provides the most important software engineering subjects and repeats or deepens new methods and techniques necessary for the project.

Responsible persons

Boll-Westermann, Susanne (Authorized examiners)

Lehrenden, Die im Modul (Authorized examiners)

Prerequisites

Skills to be acquired in this module

****Professional competence:****The students

- can explain the basics of image processing and know which algorithms exist for the basic tasks in image processing and how these are applied.
- can apply basic methods of image processing they learned in the lecture to solve simple problems.

****Methodological competence:**** The students

- can recognize and evaluate image properties and decide for suitable image processing methods.
- can select existing software packages for simple image processing problems, as well as use and customize them for their specific task.

- can implement simple image and media processing functions in a higher programming language (e.g., C ++).

****Social competence**** The students:

- can plan, implement, and document a software project in team work.
- can present the results of their work to an audience and adequately respond to criticism and questions.

****Self competence**** The students:

- can accept and learn from mistakes made during the process of implementation.

Module contents

The lecture covers the technologies of media processing. In particular, the lecture focuses on image processing chain from digital imaging, through image pre-/and postprocessing, and image storage to image analysis. In addition to compression techniques and color space theory (RGB, HSV, YUV, CIEXYZ, ...), the topics of the lecture include image enhancement, feature extraction, feature description, image analysis and image comprehension. The lecture furthermore discusses the encoding and analysis of video and audio.

Prerequisites	
Skills to be acquired in this module	<p>The objective of this module is to introduce advanced concepts and technologies of the Java Standard Edition. The students will be able to use the technologies to implement large applications.</p> <p>Professional competence: The students: - name the essential packages of the JDK class library - structure large programs properly and implement them extensively - look up required classes in the JDK-Library and solve problems with these classes - structure their programs properly - understand and interpret large programs of other students - evaluate the quality of large programs related to their maintainability, reuseability and expandability</p> <p>Methodological competence: The students: - search for solutions to specific problems in the internet independently</p> <p>Social competence: The students: - discuss own and solutions of other students</p> <p>Self-competence: The students: - reflect their problem-solving behaviour and take up new solutions, e.g. from the internet</p>

Module contents

A selection of the following subjects is presented during the lectures:

- GUI (AWT, Swing, JavaFX)
- Java-Basics and Collection-API
- Graphics and multimedia
- Events
- Model-View-Control (MVC)
- Threads
- Internationalization, localization
- Reflection
- IO, Files
- Tools (compiler, classloader, printer, ...)
- Storage technologies (XML and serialization)
- Distributed programming (sockets and RMI)
- Databases (JDBC)
- Compression
- Security concepts

Alternatively, a single topic is explored in depth.

As part of the exercises, individual programming tasks or a larger programming task will be worked on. The tasks are related to the topic of the individual lecture contents.

Prerequisites	Empfehlung: inf200 „Grundlagen der Technischen Informatik“

Skills to be acquired in this module

Diese Veranstaltung versetzt die Studierenden in die Lage, informationstechnische Systeme zu analysieren, einzelne Komponenten von Rechnern zu verstehen, sie zu entwerfen und zu optimieren sowie qualifiziert über domänenspezifischen Hardwareentwurf zu diskutieren.

Fachkompetenz:

Die Studierenden

- beschreiben einzelne Komponenten von Rechnern
- entwerfen und optimieren einzelne Komponenten von Rechnern
- entwerfen und optimieren Automaten
- spezifizieren und implentieren autonome Systeme

Methodenkompetenz

Die Studierenden

- synthetisieren Rechnerarchitekturen
- können Methoden des Hardwareentwurfs auf verschiedene Systeme transferieren

Sozialkompetenz

Die Studierenden

- diskutieren qualifiziert über Hardware

Selbstkompetenz

Die Studierenden

- sind dazu in der Lage, ihren Kenntnisstand klar gegen Fachkräfte verwandter Disziplinen abzugrenzen

inf406 - Laboratory Real-Time Systems

Module label	Laboratory Real-Time Systems
Module code	inf406
Credit points	6.0 KP
Workload	180 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Computing Science (Bachelor) > Akzentsetzungsbereich - Wahlbereich Informatik• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Praktische Vertiefung (60 KP)• Master of Education Programme (Vocational and Business Education) Computing Science (Master of Education) > Praktische Vertiefung der Informatik
Responsible persons	Olderog, Ernst-Rüdiger (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	Theoretische Informatik I und II
Skills to be acquired in this module	<p>The students learn about methods and tools, and how to apply, specify, simulate, verify, and implement real-time systems (RTS). The students gain hands-on experience using tangible Mini-Robots (Lego Mindstorms).</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• implement RTS with Lego Mindstorm Robots NXT• simulate and verify RTS on the basis of real-time automata with the model checker UPPAAL• apply the tool Moby/RT to specify and simulate RTS on the basis of PLC-Automata, and to translate them into Java-Code for Lego Mindstorms NXT and into UPPAAL <p>Methodological competence The students:</p> <ul style="list-style-type: none">• realise control tasks with Lego Mindstorms• specify RTS as networks of real-time automata and verify them with UPPAAL• design RTS using Moby/RT• realise systematically sophisticated time-dependent control tasks with Moby/RT, Lego Mindstorms, and UPPAAL <p>Social competence The students:</p> <ul style="list-style-type: none">• solve tasks in a team• present solutions and discuss them <p>Self-competence The students:</p> <ul style="list-style-type: none">• recognise (sub-)problems of RTS and are responsible for their realisation
Module contents	<p>Real-time-systems are systems, where the time at which an output is generated or at which data are read is of importance. Compared to usual programming methods, RTS models are extended by the additional dimension of time. An example for a RTS is an airbag in a car, which needs to be triggered at the right moment of time, not too early and not too late, because the effect of the airbag is useful only for a few hundredths of seconds.</p> <p>The course introduces methods and tools which are then practically applied to specify, verify, and implement RTS. The students gain hands-on experience using Mini-Robots (Lego-Mindstorms) to implement RTS.</p>

Responsible persons	Nebel, Wolfgang (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>The participants learn to understand the construction of digital circuits and digital computers. They know the technological parameters, the state of the art technologies, and the developments characterizing current and future design paradigms for digital hardware.</p> <p>They learn to understand the concepts underlying current computer architectures and are able to explain how such architectures execute programs.</p> <p>Successful participants will be able to analyse computer architectures as a whole, to understand in depth, to analyze, and to optimize their hardware components, and to discuss the properties induced by selecting design alternatives.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• identify the fundamental components of digital circuitry and digital computers,• are aware of the virtues of hierarchical and abstract descriptions of hardware systems,• name the fundamental parameters, criteria, conditions, and development trends of current and future hardware design• describe the basic concepts of current computer architectures and the execution of machine programs <p>Methodological competence The students:</p> <ul style="list-style-type: none">• evaluate computer architectures• design and optimize digital hardware components• transfer systematic methods of hardware design to unknown design problems <p>Social competence The students:</p> <ul style="list-style-type: none">• present their understanding of the operational principles underlying digital computers to others
Module contents	This module is the first part of the introduction to computer engineering. It explains the construction principles of computers, from the implementation of an easy Instruction Set Architecture and fundamental methods for the specification, construction and optimization of computer components to elementary components.

Prerequisites	
Skills to be acquired in this module	<p>The module qualifies students to analyse computer architectures, understand computer components, design and optimize computers and components, and to discuss domain-specific hardware design.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• describe computer components• design and optimise computer components• understand manufacturing processes for VLSI circuits <p>Methodological competence The students:</p> <ul style="list-style-type: none">• analyse computer architectures <p>Social competence The students:</p> <ul style="list-style-type: none">• discuss computer hardware and manufacturing processes competently• are able to transfer their knowledge of hardware design to other domains different from computer science <p>Self-competence The students:</p> <ul style="list-style-type: none">• are able to assess their own competences in relation to qualified personnel from related domains
Module contents	<p>This module is the second part of the introduction to technical computer science. Typical examples of combinatory circuits, like an adder, are used to illustrate modular design methods. More advanced design methods are demonstrated on sequential circuits, i.e. circuits with memory. Additionally in this part, the electrotechnical fundamentals of computing are taught. The construction and the manufacturing process of digital components is explained and the scope of the introduction to computer architecture is broadened to cover embedded systems as well.</p>

Prerequisites	
Skills to be acquired in this module	<p>This module provides an introduction to the design of digital embedded systems.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• name functional and non-functional requirements to specify embedded systems• discuss design space and associated embedded systems design methods• name control and feedback control systems' core concepts• characterise the fundamental digital signal processing algorithms <p>Methodological competence The students:</p> <ul style="list-style-type: none">• design and develop embedded feedback control systems with modelling tools• implement an embedded hardware-/software system according to a given specification• analyze various specification languages according to different properties <p>Social competence The students:</p> <ul style="list-style-type: none">• implement solutions to given problems in teams• present results of computer science problems to groups• organize themselves as a team to solve a larger problem using project management methods <p>Self-competence The students:</p> <ul style="list-style-type: none">• acknowledge the limits of their ability to cope with pressure during the implementation process of systems• solve exercises self-responsibly
Module contents	<p>Embedded systems support complex feedback problems, control problems and data processing tasks. They have an important value creation potential for telecommunications, production management, transport and electronics. The functionality of embedded systems is realised by the integration of processors, special hardware and software. The embedded systems design is influenced by the heterogeneity of system architectures, the complexity of systems and technical and economic requirements.</p> <p>This module gives an overview of embedded systems and their design. The process of digital signals is especially important for telecommunications and multimedia. For this purpose, the module introduces digital signal processing algorithms. The principles of feedback control are introduced by exemplary transport applications. Subsequently, the module provides the specifications and language characteristics of the embedded system design. For this purpose, graphical data-flow modelling languages (for instance Simulink) and control-flow specifications (for instance State Charts) are presented. The module closes with the concepts of possible architectures and communication models.</p> <p>Hands-on exercises with the tools Matlab/Simulink/StateFlow support the module contents.</p>

Responsible persons	Fränzle, Martin Georg (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>Embedded computer systems sustain a permanent interaction with their environment. This interaction may lead to hardly predictable stimuli and reponse sequences, which complicates the design and validation of such systems tremendously.</p> <p>As in more mature engineering disciplines, formal analytical models have been proposed as a remedy. Their role in the design flow is equivalent to the use of structural analysis and material science within, e.g., building statics. Pertinent formal methods for and formal models of embedded systems cover, for instance, execution time, power demand, and possible system dynamics.</p> <p>As they represent relevant aspects of a system in a formal, mathematical way, they often permit automatic analysis - i.e., to derive characteristic data - and automatic certificate generation. The distinguishing factor to more traditional forms of analysis like testing and profiling is the exhaustive form of analysis achieved by mathematical methods, which guarantee that the results apply for any environmental interaction. This is in stark contrast to the inherently incomplete coverage provided by test-based methods.</p> <p>The lectures explain a series of increasingly more expressive formal models and the related automatic analysis techniques. The exercise classes complement these theoretical insights by hands-on experience with state of the art formal analysis tools and offer the possibility to build such tools oneself.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• Evaluate the consequences of certificates applied by formal methods• Evaluate the suitability of available verification tools for a partial aspect and system class• Use these tools and interpret their results and improve the examined system• Prepare system models for automatic analysis methods and abstract or encode the systems symbolically (or otherwise) accordingly• Design and implement verification algorithms <p>Methodological competence The students:</p> <ul style="list-style-type: none">• Are able to model complex and heterogeneous systems by adequate mathematical modelling techniques• Know pertinent mathematical models for system dynamics and are able to transfer them to other problem domains. <p>Social competence The students:</p> <ul style="list-style-type: none">• Develop and implement fundamental verification algorithms in teams• Discuss the relative merits of alternative algorithms and formalisms <p>Self-competence The students:</p>
Module contents	<p>The module explains semantic models for reactive, real-time, and hybrid discrete-continuous systems and gives examples for pertinent specification logics. It gradually develops state-exploratory verification algorithms, both of explicit-state and symbolic shape, as relevant to the development of reliable hardware and software systems.</p> <p>The lectures present the semantic, logical, and algorithmic foundations of the automatic analysis for embedded software systems. The exercise classes complement this by providing space for experimenting with formalisms and tools in teams. The second half of the semester is dedicated to the semester project, which either deals with implementing an automatic verifier or with in-depth usage of existing tools on examples of industrially</p>

Vorkenntnisse / Previous knowledge

Fundierte Grundkenntnisse in mathematischer Logik, diskreter Mathematik, Automaten- und Berechenbarkeitstheorie, wie sie in den Modulen "Diskrete Strukturen" und "Theoretische Informatik I + II" vermittelt werden. Zudem Programmierkenntnisse, wie sie im "Programmierkurs" erworben werden.

Begründung: Die in der Vorlesung vorgestellten Verfahren basieren auf einer Operationalisierung von Semantik durch Reduktion auf logische Kodierungen und mechanisierte Prüfung logischer Aussagen. Ein Verständnis dieser Inhalte sowie ihre werkzeugtechnische Umsetzung bedarf der Grundlagen aus den vorgenannten Veranstaltungen.

inf208 - Microrobotics and Microsystems Technology

Module label	Microrobotics and Microsystems Technology
Module code	inf208
Credit points	6.0 KP
Workload	180 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Computing Science (Bachelor) > Akzentsetzungsbereich - Wahlbereich Informatik• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Wahlpflicht Technische Informatik (30 KP)• Master of Education Programme (Gymnasium) Computing Science (Master of Education) > Wahlpflichtmodule (Technische Informatik)• Master's Programme Computing Science (Master) > Nicht Informatik
Responsible persons	Fatikow, Sergej (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners) Fatikow, Sergej (Module responsibility)
Prerequisites	
Skills to be acquired in this module	<p>Within the last few years, microrobotics and microsystem technology (MST) have become a focus of interest to industry and evolved into an important field with great application potential. It plays a decisive role for industry to be competitive in many areas such as medicine, production engineering, biotechnology, environmental technology, automotive products, etc. Despite of the growing interest in this new technology, there is hardly any book or lecture course that treats microrobotics and MST in a coherent and comprehensive way. This course is an attempt of the Microrobotics and Control Engineering Division (AMiR) to give students a systematic introduction to microrobotics and MST. It discusses all important aspects of this rapidly expanding technology, its diversity of products and fields of application. The course contains an overview of numerous ideas of new devices and the problems of manufacturing them.</p> <p>Professional competence: The students:</p> <ul style="list-style-type: none">• name the ideas, challenges and activities of microrobotics and microsystem technology• describe the microrobotics and MST applications• characterise MST methods• name microsensor functionality• characterise microsensor examples• discuss MST terms of information technology• classify microrobotics <p>Methodological competence The students:</p> <ul style="list-style-type: none">• discover interdisciplinary connections and links between scientific and technical fields of research and development• learn technical abstraction of complex contexts <p>Social competence The students:</p> <ul style="list-style-type: none">• solving problems partially as group• present their solutions and approaches to the group <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their knowledge of technical computer science• learn to expand on their professional competence independently
Module contents	Ideas and problems of microrobotics and MST; applications; techniques of MST; silicon-based micromechanics; LIGA technology; microactuators: principles and examples (electrostatic, piezoelectric, magnetostrictive, electromagnetic, SMA-based, thermomechanical, electrorheological and other actuators); microsensors: principles and examples (force and pressure, position and speed, acceleration, biological and chemical, temperature and other sensors); MST and information processing; microsystem design and simulation; classification of microrobots; coarse positioning of a microrobot; fine positioning of a microrobot; handling of microparts: problems and solutions; micro grasp techniques; microassembly; process automation by

microrobots; desktop robot cell in SEM

inf400 - Theoretical Computer Science: Logic

Module label	Theoretical Computer Science: Logic
Module code	inf400
Credit points	6.0 KP
Workload	180 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Computing Science (Bachelor) > Basismodule• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Wahlpflicht Theoretische Informatik (30 KP)
Responsible persons	Olderog, Ernst-Rüdiger (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>Introduction to propositional logic, predicate logic, logic programming, and temporal logic</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• Know syntax, semantics and applications of propositional logic, predicate logic, logic programming, and temporal logic• Specify problems by using logical formulas• Solve questions concerning propositional formulas with truth tables• Draw conclusions in the field of propositional logic and predicate logic by means of natural deduction• Answer queries to logic programs by using SLD resolution• Perform model checking of Kripke structures with regard to CTL formulas algorithmically <p>Methodological competence The students:</p> <ul style="list-style-type: none">• Recognize logic as a versatile tool in computer science <p>Social competence The students:</p> <ul style="list-style-type: none">• Work together in small groups to solve problems• Present solutions to problems to groups of other students <p>Self-competence The students:</p> <ul style="list-style-type: none">• Learn persistence in pursuing difficult tasks• Learn precision in writing down solutions
Module contents	<p>The course introduces propositional, predicate and temporal logic. In computer science it is essential to have a good understanding of logic because the language of logical formulas is widely used in the field of computer science. For example, Boolean expressions appear in every programming language and in circuit design; Horn clauses are used in knowledge representation; predicate logic and temporal logic are used for specifying software and hardware. More recent applications such as interactive and automatic proving as well as the logic programming language PROLOG emphasize the tool character of logic in computer science.</p> <p>The course introduces syntax, semantics, procedures, and calculi to prove the validity of formulas of propositional, predicate, and temporal logic. This is illustrated by many examples. Central is the concept of logical consequence.</p> <p>Topics:</p> <ul style="list-style-type: none">• Propositional logic: syntax and semantics, truth tables, natural deduction• Predicate logic: syntax and semantics, natural deduction• Logic programming: declarative and procedural semantics, unification algorithm (Robinson), SLD resolution, PROLOG <p>-Temporal logic CTL: syntax and semantics of Kripke structures, CTL model checking algorithm</p>

Responsible persons	Lehrenden, Die im Modul (Authorized examiners) Olderog, Ernst-Rüdiger (Module responsibility)
Prerequisites	
Skills to be acquired in this module	Introduction to the theory of automata, formal languages, computability, and complexity Professional competence The students: <ul style="list-style-type: none">• Know different classes of languages (e.g. regular and context-free languages)• Know automata models corresponding to the respective language classes (e.g. finite automata, pushdown automata, Turing machines)• Construct automata, Turing machines, and grammars for given tasks• Know equivalent formalisations of the concept of algorithm• Classify functions as algorithmically computable and problems as algorithmically decidable• Know and recognize undecidable problems• Evaluate the complexity of algorithms• Know problems that are solvable deterministically or nondeterministically in polynomial time Methodological competence The students: <ul style="list-style-type: none">• Learn about the power of abstract models of computation Social competence The students: <ul style="list-style-type: none">• Work together in small groups to solve problems• Present solutions to problems to groups of other students Self-competence The students: <ul style="list-style-type: none">• Learn persistence in pursuing difficult tasks• Learn precision in writing down solutions
Module contents	<p>In the first part of the course, different classes of languages are introduced (regular and context-free languages). For each class a matching automata model is presented (finite automata, pushdown automata). Various properties are proven for the introduced classes of languages and models of automata.</p> <p>In the second part of the course, we examine which functions are computable and which problems are decidable. To this end, the concept of algorithm is formalised. Turing machines and grammars turn out as equivalent approaches. We show that there are problems that are undecidable. Many of these problems are of practical interest.</p> <p>The third part of the course deals with the complexity of algorithms, i.e. how much time and space is required to solve a problem. In particular, we consider problems that are solvable in polynomial time, either deterministically or non-deterministically. These problems are classified as P and NP.</p>

Module contents	Graphs are practically used in all areas of computer science to display complex structures. Some examples are flow charts, circuit diagrams, record structures, parse trees and functional and logical expressions. Such structures can be dynamically changed by graph rewriting systems. The changing process is represented by rewriting rules. This module gives an introduction to the field of graph transformation systems. It deals with reversibility, embedding and restriction of derivations, sequential and parallel independency, termination and confluence.

Prerequisites	
Skills to be acquired in this module	<p>Cryptology is a key technology for the security of worldwide computer nets. Modern cryptographic techniques are used to keep data secret, sign electronic messages, control computer network access, secure electronic financial transactions, protect copyrights, among others. In view of these applications users should be able to assess the efficiency and security of these key technologies. For this purpose, it is important not only to know the function of cryptographic processes, it is also important to understand their mathematical basics. Both is explained in this module.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• identify basic concepts of cryptography and explain them by examples• know relevant cryptosystems, apply them and assess their security• are familiar in using mathematical basics of cryptographic algorithms• implement cryptographic algorithms and prove their correctness and estimations of their complexity <p>Methodological competence The students:</p> <ul style="list-style-type: none">• assess the efficiency and security of cryptographic processes• extend their knowledge about algorithms and their complexity• develop their implementation skills in particular the handling of very large numbers• analyze simple encryption using well-known and own techniques <p>Social competence The students</p> <ul style="list-style-type: none">• use the language of mathematics to discuss in groups with different knowledge about problems• present their ideas in an understandable way• expand and improve their own ideas through the proposals of their fellow students <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their knowledge about security in IT systems• reflect their knowledge about algorithms and their complexity• experience the development of a new field of knowledge within a short amount of time• discover new applications of mathematical contexts
Module contents	A) Mathematical Basics: Integers; Polynomials; Congruences; Residue Class Rings B) Encryption C) Probability and Perfect Security D) Symmetric Encryption (DES, AES) E) Generation of Prime Numbers F) Public-Key-Encryption G) Factorisation and Discrete Logarithms H) Cryptographic Hash Functions and Digital Signatures I) Identification and Certification
Reader's advisory	Lecture notes; further literature will be announced in the lecture. For attunement: Singh, Simon: The Code Book: Science of Secrecy from Ancient Egypt to Quantum Cryptography. Anchor, 2000.

inf404 - Petri Nets

Module label	Petri Nets
Module code	inf404
Credit points	6.0 KP
Workload	180 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Computing Science (Bachelor) > Akzentsetzungsbereich - Wahlbereich Informatik• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Wahlpflicht Theoretische Informatik (30 KP)• Master of Education Programme (Gymnasium) Computing Science (Master of Education) > Wahlpflichtmodule (Theoretische Informatik)
Responsible persons	Best, Eike (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>The behaviour of modern, highly parallel, digital systems may be extremely complex. Graphical and algorithmic support may be very valuable in facilitating their design, construction, and analysis. Petri nets are a basic, widely used graphical model for the specification of parallel systems. They also provide and support a range of flexible algorithmic methods for the analysis of such systems. This module teaches the basic theory and applications of Petri nets, for the purpose of specifying and visualising, as well as for constructing and analysing highly parallel systems.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• define basic concepts of Petri nets• classify Petri nets according to their salient properties• analyse and synthesise Petri nets• apply Petri nets in the context of well-defined problems <p>Methodological competence The students:</p> <ul style="list-style-type: none">• can apply specification and analysis methods based on Petri nets <p>Social competence The students:</p> <ul style="list-style-type: none">• present solutions to given problems to a wider audience
Module contents	<ul style="list-style-type: none">• Basic concepts of Petri net theory.• Petri net languages.• Reachability and coverability.• Marking equation.• Linear-algebraic and graph-theoretic structure of Petri nets.• Free-choice nets.• Program verification using traps.• Computing functions with nets.• Unfoldings.• High-level nets.
Reader's advisory	<ul style="list-style-type: none">• Best/Wimmel: Skript Petrinetze (Oldenburg, 2015).• Secondary literature: Priese/Wimmel: Petri Netze (Springer-Verlag, 2001).

inf405 - Algorithmic Graph Theory

Module label	Algorithmic Graph Theory
Module code	inf405
Credit points	6.0 KP
Workload	180 h
Applicability of the module	<ul style="list-style-type: none">• Bachelor's Programme Computing Science (Bachelor) > Akzentsetzungsbereich - Wahlbereich Informatik• Dual-Subject Bachelor's Programme Computing Science (Bachelor) > Wahlpflicht Theoretische Informatik (30 KP)• Master of Education Programme (Gymnasium) Computing Science (Master of Education) > Wahlpflichtmodule (Theoretische Informatik)
Responsible persons	Wilkeit, Elke (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>Graphs are the most frequently used abstraction in computer science. Every system which consists of discrete states or objects and relations between these can be modelled as a graph. Most applications require efficient algorithms to process such graphs (Turau, 1996). This module provides typical graph theory problems and algorithmic solutions. They are discussed with regard to their efficiency and applicability and many of the algorithms will be implemented. An important aspect of this module is to consider different approaches to problems and learn different solution strategies.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• identify basic terms of graph theory and optimization and illustrate them with examples• name typical graph theory problems and algorithmic solutions• identify situations where graph algorithms can be applied• discuss typical graph theory problems and algorithmic solutions with regard to their efficiency and applicability.• implement graph algorithms• know proof strategies and are able to apply them <p>Methodological competence The students:</p> <ul style="list-style-type: none">• extend their knowledge about algorithms and their complexity• develop their programming skills• expand their range of methods of mathematical modelling <p>Social competence The students:</p> <ul style="list-style-type: none">• use the language of mathematics to discuss problems in groups with different knowledge levels• present their ideas in a comprehensible way• Expand and improve their own ideas through the comments of their fellow students <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their knowledge about algorithms and their complexity• develop appropriate solutions for given problems• challenge methods of resolution
Module contents	A) Trees B) Search Algorithms C) Graph Coloring D) Flows in Networks E) Applications of Network Algorithms F) Shortest Paths G) Approximation Algorithms G) Approximation Algorithms
Reader's advisory	Jungnickel, Dieter: Graphs, Networks and Algorithms. Springer, Berlin, Heidelberg, 4th edition, 2013. Available as an E-Book in BIS. A detailed bibliography is contained in the lecture notes of this module.

Responsible persons	Olderog, Ernst-Rüdiger (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>Introduction to methods for proving the correctness of sequential, parallel, and distributed programs.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• Describe operational semantics of sequential, parallel, and distributed programs• Know the concepts of partial and total correctness of programs• Establish soundness and completeness of proof systems• Construct input-output specifications of programs• Conduct correctness proofs for programs of different classes with the help of proof rules• Check interference and deadlock freedom of parallel programs• Transform parallel and distributed programs into nondeterministic programs <p>Methodological competence The students:</p> <ul style="list-style-type: none">• Recognize correctness as an important aspect of programs and informatics systems <p>Social competence The students:</p> <ul style="list-style-type: none">• Work together in small groups to solve problems• Present their solutions to groups of other students <p>Self-competence The students:</p> <ul style="list-style-type: none">• Learn persistence in pursuing difficult tasks• Learn precision in specifying problems
Module contents	<p>Program verification is a systematic approach to show the absence of errors in programs. For this purpose desirable behavioural properties of a given program are proven. For instance, a sorting program should only deliver sorted arrays.</p> <p>Partial correctness, termination, and the absence of runtime errors are essential for sequential programs. Additional behavioural properties are of interest for parallel programs: absence of interference, absence of deadlocks, and fair behaviour.</p> <p>The module focuses on the verification of parallel programs. For this purpose classic methods of Hoare's logic are combined with more recent techniques of program transformation. Sequential programs are covered in preparation for this.</p>
Reader's advisory	<p>essential: "K.R. Apt, E.-R. Olderog, Programmverifikation, Springer-Verlag, 1994"</p> <p>Or the extended English version: "K.R. Apt, F.S. de Boer, E.-R. Olderog, Verification of Sequential and Concurrent Programs, Third Edition, Springer-Verlag, 2008"</p>

Responsible persons	Olderog, Ernst-Rüdiger (Authorized examiners) Lehrenden, Die im Modul (Authorized examiners)
Prerequisites	
Skills to be acquired in this module	<p>Algorithms are presented that enables an automatic analysis and verification of complex structures as used in software systems. In the exercises these algorithms will be implemented and applied to case studies.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• conduct CTL model checking using examples• construct abstract Kripke structures on the basis of given data abstractions and apply abstraction refinement <p>to examples</p> <ul style="list-style-type: none">• characterise the concepts of simulation and bisimulation• understand the concept of data and transition abstraction• describe model checking methods as instances of fixed-point algorithms <p>Methodological competence The students:</p> <ul style="list-style-type: none">• specify reactive systems by means of Kripke structures and CTL formulas• implement model checking methods using Java <p>Social competence The students:</p> <ul style="list-style-type: none">• work in small groups <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their actions and use newly learned methods
Module contents	<p>Software systems consist of complex data and control structures and growing state spaces, which makes testing their correctness difficult. The big challenge for computer science is the development of automatic methods to analyse and to verify software systems' properties. In this course, algorithms for program analysis and model checking are presented and applied. The algorithms process transition systems generated from software and use abstraction techniques for data and transitions to make the state spaces analysable.</p> <p>Topics: Kripke structures, transition systems, temporal logic CTL and CTL*, fixed-point algorithms for recursive CTL-operators, model checking algorithms for CTL, simulation and bisimulation of Kripke structures, theorems on the preservation of properties under (bi-) simulations, existential und universal abstraction of Kripke structures, counterexample-guided abstraction refinement (CEGAR method)</p>
