Skills to be acquired in this module

Programming is one of the basic activities of computer scientists and a prerequisite for many other courses on the computer science degree programme. The aim of the '*Programming, Algorithms and Data Structures*' module is to learn the basic concepts of imperative, procedural and object-oriented programming using the Java programming language and to present known, efficient algorithms and data structures for various frequently occurring problems.

After completing the module, students should be able to independently develop imperative and simple object-oriented programmes based on Java to solve small problems and assess the efficiency of their programmes. They should also be able to apply important algorithms and select them based on their complexity.

Subject-related competences

The students

- describe basic concepts of imperative programming with Java
- recognise the terminology of imperative programming and use the corresponding terms precisely in discussions
- recognise basic terminology of object-oriented programming
- describe what programmes presented to them do
- develop programmes independently to solve small problems
- systematically examine their own and other people's programmes for errors
- use modern programme development environments to develop and test programmes
- create algorithms with general design concepts (e.g. greedy method, divide-and-conquer method)
- name algorithms and data structures for solving frequently occurring problems and evaluate their applicability
- name problems of the efficiency of algorithmic solutions to specific problems and evaluate them
- select an algorithm and a data structure to solve a specific problem in a well-founded manner
- apply the algorithms and data structures they have learnt in a meaningful way to given and concrete problems

Methodological competences

The students

-
- solve given problems from the point of view of imperative or object-orientated programming
 - transfer practical experience in programme development to new tasks

Social competences

The students

- communicate the structure and mode of operation of self-developed programmes to others
- present independently developed solutions to small tasks to groups

Self-competences

The students

- organise themselves when finding algorithmic solutions for small and medium-sized problems in computer science
- incorporate the concepts of general programme design into their work

Module contents

In the first part, general basic concepts of programming are introduced:

- Algorithm, programming languages, computer
- development tools, development phases
- compilers
- grammars
- Logic

The second part deals with basic programming concepts:

- data types
- variables
- expressions, statements
- control structures
- methods, parameters
- recursion
- reference data types, arrays
- classes, objects
- documentation
- testing

The third part contains an introduction to data structures and algorithms as well as a discussion of their efficiency, i.e. the computational effort and memory requirements depending on the amount of data to be processed. The module presents known, efficient algorithms and data structures for various frequently occurring problems. These include in particular

- methods for searching for keys, as well as insertion and deletion in dynamic data sets, e.g. lists, trees, AVL trees or hash methods,
- methods for searching for text patterns,
- methods for sorting data according to key values, e.g. QuickSort and HeapSort,
- graph-based applications, e.g. for determining the shortest paths in graphs.

The lecture section is supplemented by a comprehensive exercise section in which the programming content taught is implemented using practical examples.

| Prerequisites | |

Useful subject-specific prior knowledge:

- imperative programming with Java
- basics of object orientation (classes and objects)
- fundamentals of algorithms (complexity, solution methods)

This prior knowledge can be acquired, **for example**, in the module *inf030 Programming, Algorithms and Data Structures*. There are **no** formal prerequisites for participation.

Skills to be acquired in this module

Object-orientation is the state of the art in software development today. Given problems are first converted into an object-oriented model and then into an object-oriented programme with the help of object-oriented analysis and design methods. The aim of the '*Object-oriented Modelling and Programming*' module is to learn the basic concepts of object-oriented modelling using UML as a modelling notation and object-oriented programming using the Java programming language. After completing the module, students should be able to independently develop object-oriented programmes based on Java to solve medium-sized problems.

Subject-related competences

The students

- know basic concepts of object-oriented modelling and UML as a modelling notation
- know basic concepts of object-oriented programming with Java
- know the terminology of object-oriented modelling and programming and use the corresponding terms precisely in discussions
- can describe what object-oriented programmes presented to them do
- develop models and programmes independently to solve medium-sized problems
- systematically examine their own and other people's models and programmes for errors
- use modern development environments for modelling and developing programs
- know the differences between the imperative, object-oriented, functional, logical and rule-based programming paradigms

Methodological competences

The students

- independently develop programs for given problems by consistently applying the concepts of object-oriented modelling and programming
- transfer practical experience in programme development to new tasks
- develop programmes with concurrency independently
- can independently apply known solution methods to complex problems

Social competences

The students

- communicate the structure and mode of operation of self-developed models and programmes to others
- present independently developed solutions to small tasks to groups

Self-competences

The students

- organise themselves when developing models and programs for small and medium-sized problems in computer science
- incorporate the concepts of object-oriented programme design into their work

Module contents

In the first part, basic concepts of object-oriented modelling and programming are taught:

- models and modelling
- UML class diagrams
- classes and objects
- data encapsulation
- inheritance
- polymorphism and dynamic binding
- exception handling
- genericity

In the second part, important concepts and classes of the JDK class library are introduced and the classes are used to solve medium-sized problems:

- Java Collection API
- I/O and streams
- parallel programming with threads
- GUI applications with JavaFX

In the third part, advanced solution strategies are presented and further programming paradigms are introduced and compared with the object-oriented paradigm:

- backtracking, branch and bound, greedy
- local search, evolutionary algorithms
- functional programming (e.g. Java-Lamdas, Standard ML)
- logical programming (e.g. Prolog)
- rule-based programming (e.g. RuleBook)

The lecture part is supplemented by a comprehensive exercise part, in which the content taught is implemented using practical examples.

he students learn to understand the construction of digital circuits and digital computers. They know the technological parameters, the state of the art technologies, and the developments characterizing current and future design paradigms for digital hardware. They learn to understand the concepts underlying current computer architectures and are able to explain how such architectures execute programs. Successful participants will be able to analyze computer architectures as a whole, to understand in depth, to analyze, and to optimize their hardware components, and to discuss the properties induced by selecting design alternatives.

Professional competences

The Students:

- identify fundamental concepts of the construction of digital computer systems, the internal number representation, and analysis of combinational logic as well as their optimization.

Methodological competences

The Students:

- analyze computer architectures on the basis of their individual components
- design and optimize digital hardware components
- transfer systematic approaches of hardware design to unknown design problems

Social competences

The Students:

- present their understanding of the functional principles of digital computer systems

Self-competences

The Students:

- critically reflect on the results of exercises and recognize limitations of different approaches to the design of digital computer systems

Module contents

This module is the first part of the introduction to computer engineering. It explains the construction principles of computers, from the implementation of an easy Instruction Set Architecture, over fundamental techniques for coding and representation of numbers, program execution on machine level, basics of logics and analysis of functions of combinational logic as well as their optimization.

Prerequisites

Basic knowledge of computer science

Skills to be acquired in this module

Professional competence

The students:

- characterise the different computer science education (CSE) concepts and approaches, e.g. the early approaches of CSE in school or the concept of computer science (CS) in contexts
- select and discuss teaching subjects by analysing didactic approaches and concepts
- describe the general education character of CS
- compare the different approaches and concepts of CSE and are able to illustrate common features and contradictions
- reflect lesson subjects by the approaches and topics of CSE

Methodological competence

The students:

- link the concepts and approaches of CSE with the educational reconstruction
- classify the similarities and differences of the concepts and approaches of CSE academically

Social competence

The students:

- discuss the concepts and approaches of CSE with students and lectures academically
- accept the thoughts of other students and lectures
- give and accept criticism objectively

Self-competence

The students:

- integrate the concepts and approaches of CSE into their planning and operations - reflect their self-perception with regard to the concepts and approaches of CSE

Module contents

The field of CSE is introduced by this module. Different CSE approaches and concepts are presented. **These CSE approaches and concepts are, e.g.:**

- early concepts of CS in schools
- general education character of CS
- idea oriented approach of CSE
- information centred approach of CSE
- CSE in elementary school

- system oriented approach Subjects like „CS projects in class“ are also part of this module.

Expected/useful experience

from inf030 Programming, Data structures and Algorithms

Professional competence

The students:

- describe basic concepts of imperative programming with Java
- recognise imperative programming terminology and use the appropriate terms accurately in discussions
- recognise basic terminology of object-oriented programming
- describe what programs presented to them do
- independently develop programs to solve small problems
- systematically examine their own and other people's programmes for errors
- use modern programme development environments to develop and test programmes
- create algorithms with general design concepts (e.g. Greedy method, divide-and-conquer method)
- name algorithms and data structures for solving common problems and evaluate their applicability
- name problems of efficiency of algorithmic solutions of concrete problems and evaluate them
- make a well-founded choice of an algorithm and a data structure for solving a concrete problem
- apply the learned algorithms and data structures sensibly to given and concrete problems

Methodological competence

The students:

- solve given problems from the point of view of imperative or object-oriented programming
- transfer practical experience in programme development to new tasks

Social competence

The students:

- communicate the structure and mode of operation of self-developed programmes to others

-
- present solutions to small tasks in front of groups

Self-competence

The students:

- organise themselves in finding algorithmic solutions to small and medium-sized problems in computer science
- incorporate the concepts of general programme design in their actions

from inf030 Object-oriented Modelling and Programming

Professional competence:

The students:

- know basic concepts of object-oriented modelling and UML as modelling notation
- know basic concepts of object-oriented programming with Java
- know the terminology of object-oriented modelling and programming and use the appropriate terms precisely in discussions
- can describe what object-oriented programmes presented to them do
- independently develop models and programmes for solving medium-sized problems
- systematically examine their own and other people's models and programmes for errors
- use modern development environments for modelling and developing programmes
- know the differences between the imperative, object-oriented, functional, logical and rule-based programming paradigms

Methodological competence:

The students:

- independently develop programmes for given problems by consistently applying the concepts of object-oriented modelling and programming
- transfer practical experience in programme development to new tasks
- independently develop programmes with concurrency
- can independently apply known solution methods to complex problems

Social competence:

The students:

- communicate the structure and mode of action of self-developed models and programmes to others
- present independently developed solutions to groups

Self-competence:

The students:

- organise themselves when developing programmes for small and medium-sized problems in computer science
- incorporate the concepts of object-oriented programme design in their actions

Skills to be acquired in this module

The objective of the module is to convey the development and maintainance of large scale software systems. The complete software developing process including requirements elicitation, software architecture and quality assurance, is covered in both classic and agile approaches. Basic concepts of object-oriented modeling and software development based on the Unified Modeling Language are covered in depth.

Professional competence

The students:

- recognize the phases in the software life cycle (requirements elicitation, design, implementation, quality assurance)
- name the tasks involved in each phase
- recognize and evaluate the arrangement of these activities in classic and agile approaches
- assess and select suitable process models for the realization of projects
- understand the advantages of the modelling process with UML
- develop and evaluate models in different UML notations and their combinations
- solve given problems with the help of UML notations

Methodological competence

The students:

- structure, evaluate, differentiate and use procedures of classic and agile project management
- structure, document and evaluate problems and solutions using the tools of object-oriented modeling
- apply methods and techniques of object-oriented modeling with UML in a targeted manner

Social competence

The students:

- create, present and discuss solutions to problems using modeling techniques
- describe and solve given modeling problems in teams

Self-competence

The students:

- reflect on their actions when describing problems and developing solutions

Module contents

The module introduces fundamental terms and concepts of software engineering.

These include

- Necessity of software engineering
- Principles of software engineering
- Activities and process models of software development (classic, agile)
- Object-oriented modeling, metamodeling
- Synchronization of code and models
- Determination and documentation of requirements (classic, agile)
- Definition of software architectures
- Use of software development patterns
- Definition and assurance of software quality
- Maintenance and operation of software systems

Prerequisites

Basic knowledge of computer science

Skills to be acquired in this module

Professional competence

The students:

- characterise the different computer science education (CSE) concepts and approaches, e.g. the early approaches of CSE in school or the concept of computer science (CS) in contexts
- select and discuss teaching subjects by analysing didactic approaches and concepts
- describe the general education character of CS
- compare the different approaches and concepts of CSE and are able to illustrate common features and contradictions
- reflect lesson subjects by the approaches and topics of CSE

Methodological competence

The students:

- link the concepts and approaches of CSE with the educational reconstruction
- classify the similarities and differences of the concepts and approaches of CSE academically

Social competence

The students:

- discuss the concepts and approaches of CSE with students and lectures academically
- accept the thoughts of other students and lectures
- give and accept criticism objectively

Self-competence

The students:

- integrate the concepts and approaches of CSE into their planning and operations - reflect their self-perception with regard to the concepts and approaches of CSE

Module contents

The field of CSE is introduced by this module. Different CSE approaches and concepts are presented. **These CSE approaches and concepts are, e.g.:**

- early concepts of CS in schools
- general education character of CS
- idea oriented approach of CSE
- information centred approach of CSE
- CSE in elementary school

- system oriented approach Subjects like „CS projects in class“ are also part of this module.

Prerequisites

Useful prior knowledge:

- PDA
- OMP

Skills to be acquired in this module

The students will be able to develop software iteratively in a team. This includes all stages of the software life cycle (requirements, analysis, design, implementation, test) and the presentation of the software development process. The students improve their Java skills. Professional competence The students: - Apply software development techniques and methods and are aware of the techniques' limitations

Professional competence:

The students:

- apply techniques and methods and recognize their limitations

Methodological competence

The students:

- develop complex software with software engineering methods using a process-model and document these appropriately
- make a rough schedule/estimate on tasks
- implement an iterative process
- familiarise themselves with unknown systems and frameworks
- process complex tasks based on science and engineering and split them in subtasks
- organise and implement small-scale projects
- present and document the outcome of the project

Social competence

The students:

- work in a team and solve conflicts
- develop complex software in a team and assess the required efforts (time management)
- reflect their self-performance and the performance of other students (review and retrospective)

Self-competence

The students:

- improve their capacity for teamwork, in particular the ability to solve conflicts

Module contents

In a two-semester course a team of students develops a larger system. For this project a Scrum similar model is used. Typical external stakeholders/roles are represented by members of the team. Feedback is provided in regular presentations (two per semester with the lecturer, weekly in the seminars). An accompanying lecture block provides the most important software engineering subjects and repeats or deepens new methods and techniques necessary for the project.

Module contents

The module "Practical Course Databases" is a related practical course of the module "Information Systems I". The objectives of this module are special technical concepts of a database system and practical solutions in database

programming and optimisation.

Contents of this module are:

- System-oriented database management programming,
- Implementation of catalogue systems,
- Optimisation strategies based on parallelisation and partitioning requirements

Zuständige Personen

- Boll-Westermann, Susanne (module responsibility)
- Lehrenden, Die im Modul (Prüfungsberechtigt)

Prerequisites

Solid programming skills in Java and/or C++, practical informatics. Interest in media processing

Skills to be acquired in this module

The students can explain the basics of image processing and know which algorithms exist for the basic tasks in image processing and how these are applied.

The students can apply basic methods of image processing they learned in the lecture to solve simple problems.

Professional competence:

The students

- can name basic characteristics of digital media
- can explain the most common methods for encoding and compressing images, video and audio
- can describe basic procedures for image enhancement, feature extraction, feature description, image analysis and image comprehension

Methodological competence:

The students

- can recognize and evaluate image properties and decide for suitable image processing methods
- can select existing software packages for simple image processing problems, as well as use and customize them for their specific task
- can implement simple image and media processing functions in a higher programming language (e.g., C ++)

Social competence

The students:

- can plan, implement, and document a software project in team work
- can present the results of their work to an audience and adequately respond to criticism and questions

Self competence

The students:

- can accept and learn from mistakes made during the process of implementation

Module contents

The lecture covers the technologies of media processing. In particular, the lecture focuses on image processing chain from digital imaging, through image pre-/and postprocessing, and image storage to image analysis. In addition to compression techniques and color space theory (RGB, HSV, YUV, CIEXYZ, ...), the topics of the lecture include image enhancement, feature extraction, feature description, image analysis and image comprehension. The lecture furthermore discusses the encoding and analysis of video and audio.

Skills to be acquired in this module

The objective of this module is to introduce advanced concepts and technologies of the Java Standard Edition. The students will be able to use the technologies to implement large applications.

Professional competence:

The students:

- name the essential packages of the JDK class library
- structure large programs properly and implement them extensively
- set up own Java class libraries
- look up required classes in the JDK-Library and solve problems with these classes
- structure their programs properly
- understand and interpret large programs of other students
- evaluate the quality of large programs related to their maintainability, reuseability and expandability

Methodological competence:

The students:

- search for solutions to specific problems in the internet independently

Social competence:

The students:

- discuss own and solutions of other students

Self-competence:

The students:

- reflect their problem-solving behaviour and take up new solutions, e.g. from the internet

Module contents

A selection of the following subjects is presented during the lectures:

- GUI (AWT, Swing, JavaFX)
- Java-Basics and Collection-API
- Graphics and multimedia
- Events
- Model-View-Control (MVC)
- Threads
- Internationalization, localization
- Reflection
- IO, Files

- Tools (compiler, classloader, printer, ...)
- Storage technologies (XML and serialization)
- Distributed programming (sockets and RMI)
- Databases (JDBC)
- Compression
- Security concepts

Alternatively, a single topic is explored in depth.

As part of the exercises, individual programming tasks or a larger programming task will be worked on. The tasks are related to the topic of the individual lecture contents.

Skills to be acquired in this module

This module integrates current computer science developments within appropriate study courses.

Professional competence

The students:

- Know recent technological or scientific computer science developments
- Transfer computer science methods and development models to IT application area requirements
- Evaluate the possibilities and limits of computer science methods and tools and apply them appropriately

Methodological competence

The students:

- Review problems, formulate them with formal models and explore them appropriately
- Identify and present (one or more) computer science problem solutions
- Select and evaluate appropriate tools and methods
- Reflect on a scientific topic and write a scientific seminar paper under guidance and present their findings

Social competence

The students:

- Use presentation methods purposefully

Self-competence

The students:

- Plan their informatical actions independently
- Reflect their contributions critically and discuss them with users and experts
- Collect and update their knowledge independently

| Skills to be acquired in this module | |

he students learn to understand the construction of digital circuits and digital computers. They know the technological parameters, the state of the art technologies, and the developments characterizing current and future design paradigms for digital hardware. They learn to understand the concepts underlying current computer architectures and are able to explain how such architectures execute programs. Successful participants will be able to analyze computer architectures as a whole, to understand in depth, to analyze, and to optimize their hardware components, and to discuss the properties induced by selecting design alternatives.

Professional competences

The Students:

- identify fundamental concepts of the construction of digital computer systems, the internal number representation, and analysis of combinational logic as well as their optimization.

Methodological competences

The Students:

- analyze computer architectures on the basis of their individual components
- design and optimize digital hardware components
- transfer systematic approaches of hardware design to unknown design problems

Social competences

The Students:

- present their understanding of the functional principles of digital computer systems

Self-competences

The Students:

- critically reflect on the results of exercises and recognize limitations of different approaches to the design of digital computer systems

Module contents

This module is the first part of the introduction to computer engineering. It explains the construction principles of computers, from the implementation of an easy Instruction Set Architecture, over fundamental techniques for coding and representation of numbers, program execution on machine level, basics of logics and analysis of functions of combinational logic as well as their optimization.

| Skills to be acquired in this module | |

The module qualifies students to analyze computer architectures, understand computer components, design and optimize computers and components, and to discuss domain-specific hardware design.

Professional Competences

The students:

- describe computer components
- design and optimise computer components
- describe and analyse electric circuits

Methodological Competences

The students:

- analyse computer architectures
- get familiar with fundamentals of the analysis and synthesis of flipflops and automata
- get familiar with foundations of the analysis of electrical circuits

Social Competences

The students:

- discuss computer hardware and manufacturing processes competently
- are able to transfer their knowledge of hardware design to other domains different from computer science

Self Competences

The students:

- critically reflect the results of exercises and acknowledge limitations of various approaches for the design of computer systems

| | |
|------------------------|--|
| Module contents | This module is the second part of the introduction to computer engineering. It explains sequential circuits (e.g. flipflops and automata), arithmetic and logical computer components, registers and memory, basics of computer communication as well as electrotechnical foundations. |

| Module contents | <p>Embedded systems support complex feedback problems, control problems and data processing tasks. They have an important value creation potential for telecommunications, production management, transport and electronics. The functionality of embedded systems is realised by the integration of processors, special hardware and software. The embedded systems design is influenced by the heterogeneity of system architectures, the complexity of systems and technical and economic requirements. This module gives an overview of embedded systems and their design. The process of digital signals is</p> |

especially important for telecommunications and multimedia. For this purpose, the module introduces digital signal processing algorithms. The principles of feedback control are introduced by exemplary transport applications. Subsequently, the module provides the specifications and language characteristics of the embedded system design. For this purpose, graphical data-flow modelling languages (for instance Simulink) and control-flow specifications (for instance State Charts) are presented. The module closes with the concepts of possible architectures and communication models. Hands-on exercises with the tools Matlab/Simulink/StateFlow support the module contents.

Module contents

Embedded computer systems maintain constant interaction with their

environment. This induces interaction sequences that are difficult to predict, which complicates the construction and validation of such systems. Akin to the use of structural models for rigorous validation of building layouts in the construction industry, formal models in computer science have consequently been developed for analysis of various aspects of computing systems in general and embedded systems in particular. They cover execution time, energy demand, or possible system dynamics of embedded systems. They represent the respective aspect of the system in a closed form and thus allow for the - often fully automatic - derivation of reliable certificates that apply to any interaction scenario with the environment. This is in contrast to methods of testing or profiling, which only test selected scenarios and thus can only provide limited coverage.

In this module, various such models are explained and methods for their fully automatic analysis -i.e., derivation certificates- or synthesis -i.e., automatic generation of correct system designs- from such models are explained and demonstrated in their application.

The exercises provide opportunity for deepening understanding through hands-on experience with domain-specific modelling and verification

tools, as well as by creating a (small) fully automated verification tool yourself in a guided process.

In the lectures, the semantic, logical, and algorithmic basics of automatic analysis of embedded software systems are taught. The primary form of instruction is the media-supported lecture as well as the didactic question-answer game,.

In the exercise classes, the knowledge acquired in the lecture is deepened and put into practice. For this purpose, in the first half of the semester, exercises are set fortnightly, the completion of which in small groups encourages independent testing of the individual understanding of the topic and peer teaching. In the second half of the semester, a larger tool development task is set, also to be pursued on in small groups of 3 students each. The work on these projects spans the entire second half of the semester and offers the possibility of project-oriented learning. In this phase, the exercise classes serve as consultation time with the lecturers; in particular, solution approaches and problems can be presented and discussed.

| Skills to be acquired in this module | <p>Within the last few years, microrobotics and microsystem technology (MST) have become a focus of interest to industry and evolved into an important field with great application potential. It plays a decisive role for industry to be competitive in many areas such as medicine, production engineering, biotechnology, environmental technology, automotive products, etc. Despite of the growing interest in this new technology, there is hardly any book or lecture course that treats microrobotics and MST in a coherent and comprehensive way. This course is an attempt of the Microrobotics and Control Engineering Division (AMiR) to give students a systematic introduction to microrobotics and MST. It discusses all important aspects of this rapidly expanding technology, its diversity of products and fields of application. The course contains an overview of numerous ideas of new devices and the problems of manufacturing them.</p> <p>Professional competence: The students:</p> <ul style="list-style-type: none">• name the ideas, challenges and activities of microrobotics and microsystem technology• describe the microrobotics and MST applications• characterise MST methods• name microsensor functionality• characterise microsensor examples• discuss MST terms of information technology• classify microrobotics <p>Methodological competence The students:</p> <ul style="list-style-type: none">• discover interdisciplinary connections and links between scientific and technical fields of research and development• learn technical abstraction of complex contexts <p>Social competence The students:</p> <ul style="list-style-type: none">• solving problems partially as group• present their solutions and approaches to the group <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their knowledge of technical computer science• learn to expand on their professional competence independently |

Module contents

Ideas and problems of microrobotics and MST:

- applications;
- techniques of MST;
- silicon-based micromechanics;
- LIGA technology;

Microactuators:

- principles and examples (electrostatic, piezoelectric, magnetostrictive, electromagnetic, SMA-based, thermomechanical, electrorheological)

and other actuators);

Microsensors:

- principles and examples (force and pressure, position and speed, acceleration, biological and chemical, temperature and other sensors);
- MST and information processing;
- microsystem design and simulation;
- classification of microrobots;
- coarse positioning of a microrobot;
- fine positioning of a microrobot;

Handling of microparts:

- problems and solutions;
- micro grasp techniques;
- microassembly;

Process automation by microrobots:

- desktop robot cell in SEM

Prerequisites

Useful prerequisites:

set theory, functions and relations

Skills to be acquired in this module

Introduction to propositional logic, predicate logic, logic programming, and temporal logic

Professional competence

The students:

- know syntax, semantics and applications of propositional logic, predicate logic, logic programming, and temporal logic
- specify problems by using logical formulas
- solve questions concerning propositional formulas with truth tables
- draw conclusions in the field of propositional logic and predicate logic by means of natural deduction
- answer queries to logic programs by using SLD resolution
- perform model checking of Kripke structures with regard to CTL formulas algorithmically

Methodological competence

The students:

- recognize logic as a versatile tool in computer science

Social competence

The students:

- work together in small groups to solve problems
- present solutions to problems to groups of other students

Self-competence

The students:

- learn persistence in pursuing difficult tasks
- learn precision in writing down solutions

Module contents

The course introduces propositional, predicate and temporal logic. In computer science it is essential to have a good understanding of logic because the language of logical formulas is widely used in the field of computer science. For example, Boolean expressions appear in every programming language and in circuit design; Horn clauses are used in knowledge representation; predicate logic and temporal logic are used for specifying software and hardware. More recent applications such as interactive and automatic proving as well as the logic programming language PROLOG emphasize the tool character of logic in computer science. The course introduces syntax, semantics, procedures, and calculi to prove the validity of formulas of propositional, predicate, and temporal

logic. This is illustrated by many examples. Central is the concept of logical consequence.

Topics:

- propositional logic: syntax and semantics, truth tables, natural deduction
- predicate logic: syntax and semantics, natural deduction
- logic programming: declarative and procedural semantics, unification algorithm (Robinson), SLD resolution, PROLOG
- temporal logic CTL: syntax and semantics of Kripke structures, CTL model checking algorithm

Literatureempfehlungen

Essential: Script "Logik" (in German), in its current edition

Recommended: D. van Dalen: "Logic and Structure", Fourth Edition. Springer-Verlag, 2004.

Good secondary reading: U. Schöning: "Logic for Computer Scientists", Birkhäuser, 1994.

Prerequisites

Useful prerequisites:

set theory, functions, relations, propositional and predicate logic

Skills to be acquired in this module

Introduction to the theory of automata, formal languages, computability, and complexity

Professional competence

The students:

- know different classes of languages (e.g. regular and context-free languages)
- know automata models corresponding to the respective language classes (e.g. finite automata, pushdown automata, Turing machines)
- construct automata, Turing machines, and grammars for given tasks
- know equivalent formalisations of the concept of algorithm
- classify functions as algorithmically computable and problems as algorithmically decidable
- know and recognize undecidable problems
- evaluate the complexity of algorithms
- know problems that are solvable deterministically or nondeterministically in polynomial time
- know the relevance of NP-complete problem

Methodological competence

The students:

- learn about the power of abstract models of computation
- know problems which are not efficiently solvable and can detect these in practical tasks

Social competence

The students:

- work together in small groups to solve problems
- present solutions to problems to groups of other students

Self-competence

The students:

- learn persistence in pursuing difficult tasks
- learn precision in writing down solutions

Module contents

In the first part of the course, different classes of languages are introduced (regular and context-free languages). For each class a matching automata model is presented (finite automata, pushdown automata). Various properties

are proven for the introduced classes of languages and models of automata. In the second part of the course, we examine which functions are computable and which problems are decidable. To this end, the concept of algorithm is formalised. Turing machines and grammars turn out as equivalent approaches. We show that there are problems that are undecidable. Many of these problems are of practical interest. The third part of the course deals with the complexity of algorithms, i.e. how much time and space is required to solve a problem. In particular, we consider problems that are solvable in polynomial time, either deterministically or non-deterministically. These problems are classified as P and NP.

Literaturempfehlungen

Prerequisites

Helpful prerequisites:

set theory, relations, functions, propositional logic, predicate logic, programming in an imperative language

Skills to be acquired in this module

Introduction to methods for proving the correctness of sequential and parallel programs.

Professional competence

The students:

- describe operational semantics of sequential and parallel programs
- Know the concepts of partial and total correctness of programs
- establish soundness and completeness of proof systems
- construct input-output specifications of programs
- conduct correctness proofs for programs of different classes with the help of proof rules
- check interference and deadlock freedom of parallel programs
- construct correctness proof for weak memory models

Methodological competence

The students:

- recognize correctness as an important aspect of programs and informatics systems
- recognize formal calculi as means of specification and verification

Social competence

The students:

- work together in small groups to solve problems
- present their solutions to groups of other students

Self-competence

The students:

- learn persistence in pursuing difficult tasks
- learn precision in specifying problems

Module contents

Program verification is a systematic approach to show the absence of errors in programs. For this purpose desirable behavioural properties of a given program are proven. For instance, a sorting program should only deliver sorted arrays. Partial correctness, termination, and the absence of runtime errors are essential for sequential programs. Additional behavioural properties are of interest for parallel programs: absence of interference, absence of deadlocks, and fair behaviour. The module focuses on the verification of parallel programs. For this purpose classic methods of Hoare's logic and their extension to parallel programs, in particular also weak memory models, are studied. Sequential programs are covered in preparation for this.
