Engineering Physics - Master's Programme
im Summer semester 2024
erstellt am 25/07/24

phy611 - Theoretical Methods	7
phy631 - Advanced Metrology	10
phy640 - Seminar Advanced Topics in EP	11
phy681 - Tools and Skills for Scientific Engineering	12
phy691 - Advanced Research Project (Preparation Master Thesis)	13
phy602 - Advanced Nuclear & Particle Physics	15
phy603 - Fluid Dynamics	17
phy607 - Selected Topics in Advanced Physics	18
phy633 - Optics	19
phy617 - Fourier Methods	20
phy950 - Audiologie und Akustik	22
bio279 - Basic Concepts in Animal Physiology	24
phy614 - Personalized Medicine	25
phy678 - Processing and analysis of biomedical data	26
phy685 - Advanced Engineering Topics in Biomedical Physics & Acoustics	27
phy686 - Advanced Topics in Biomedical Physics & Acoustics	28
phy698 - Selected Topics on Medical Radiation Physics	29
phy959 - Medizinische Strahlenphysik II	31
phy955 - Medizinische Strahlenphysik I	32
phy964 - Advanced Computing	33
phy954 - Imaging and Data Analysis	34

phy608 - Medical Optics	35
phy632 - Spectrophysics	36
phy634 - Biophotonics and Spectroscopy	37
phy637 - Laser Design and Beam Guiding	39
phy638 - Laser material processing	40
phy682 - Advanced Engineering Topics in Laser and Optics	41
phy683 - Advanced Topics in Laser and Optics	42
phy965 - Engineering Scientific Instrumentation	43
phy966 - Intense Light Physics	44
phy600 - Photonics	45
phy624 - Optoelectronics	46
inf511 - Smart Grid Management	47
phy609 - Photovoltaic Physics	49
phy616 - Computational Fluid Dynamics 1 / 2	50
phy641 - Energy Resources & Systems	52
phy644 - Wind Energy Physics, Data & Analysis	54
phy646 - Wind Physics Student's Lab	56
phy647 - Future Power Supply Systems	58
phy648 - Wind Resources and their Applications	60
phy649 - Design of Wind Energy Systems	62
phy687 - Advanced Engineering Topics in Renewable Energies	64
phy689 - Advanced Topics in Renewable Energies	65
phy984 - Semiconducting Materials for Solar Energy	66

phy987 - Control of Wind Turbines and Wind Farms	67
phy967 - Advanced Laboratories in Renewable Energies	69
pre022 - Solar Energy	70
pre113 - Photovoltaic Systems	73
pre114 - Solar Energy Meteorology	76
phy964 - Advanced Computing	78
pre200 - Selected Renewable Energy Technologies	79
phy616 - Computational Fluid Dynamics 1 / 2	81
phy659 - Introduction to Micro Meteorology for Wind Energy	83
phy670 - Fluidynamics II/Wind Energy Meterology	84
phy673 - Diffusions and Stochastic Differential Equations	85
phy674 - Turbulent Flows	86
phy684 - Wind Turbine Technology and Aerodynamics	87
phy688 - Planning and Development of Wind Farms	88
phy692 - Research Project EWEM	89
phy991 - Stochastic Processes	90
phy992 - Time Series Analysis	91
phy993 - Advanced Time Series Analysis	92
phy994 - Optimization and Data Fitting	93
phy995 - Physics of Sustainable Energy	94
phy996 - Offshore Wind Energy	95
phy997 - Wind Turbine Measurement Techniques	96
phy998 - Probabilistic Methods in Wind Energy	97

phy621 - Advanced Engineering Topics in Wind Energy	98
phy622 - Advanced Topics in Wind Energy	99
phy645 - Wind Physics Measurement Project	100
phy985 - Stochastic Processes in Experiments	101
phy629 - Optimization in modern Power Systems	102
phy675 - Integration of Wind Power in the Power System	103
phy981 - HardTech Entrepreneurship	104
phy986 - System Safety and Reliability Engineering	105
phy623 - Advanced Wind Energy Meteorology	106
phy625 - Deep Learning	107
phy626 - Introduction to Dynamical Systems	108
phy988 - Introduction to Machine Learning and Data Mining	109
phy627 - Hydrodynamics II	110
phy628 - Computational Tool for Data Science	111
phy629 - Advanced CFD	112
phy657 - Energy Economics	113
phy605 - Digital Signal Processing	114
phy677 - Speech processing	115
phy679 - Acoustics	116
phy685 - Advanced Engineering Topics in Biomedical Physics & Acoustics	117
phy686 - Advanced Topics in Biomedical Physics & Acoustics	118
phy694 - Machine Learning II	119

phy696 - Advanced Topics Speech and Audio Processing

mam - Master's Thesis Module	
.....	123

Pflichtmodule

phy611 - Theoretical Methods

Module label	Theoretical Methods
Modulkürzel	phy611
Credit points	6.0 KP
Workload	180 h (attendance: 56 hrs, self study: 124 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Pflichtmodule
Zuständige Personen	<ul style="list-style-type: none"> • Cocchi, Caterina (module responsibility) • Anemüller, Jörn (Prüfungsberechtigt) • Avila Canellas, Kerstin (Prüfungsberechtigt) • Cocchi, Caterina (Prüfungsberechtigt) • Doclo, Simon (Prüfungsberechtigt) • Hartmann, Alexander (Prüfungsberechtigt) • Kühn, Martin (Prüfungsberechtigt) • Kunz-Drolshagen, Jutta (Prüfungsberechtigt) • Neu, Walter (Prüfungsberechtigt) • Peinke, Joachim (Prüfungsberechtigt) • Poppe, Björn (Prüfungsberechtigt) • Schmidt, Thorsten (Prüfungsberechtigt) • Stoevesandt, Bernhard (Prüfungsberechtigt) • Strybny, Jann (Prüfungsberechtigt)
Prerequisites	basic programming skills (matlab, python, C/C++)
Skills to be acquired in this module	<p>Computational Fluid Dynamics (CFD I & II)</p> <ul style="list-style-type: none"> • Deeper understanding of the fundamental equations of fluid dynamics. • Overview of numerical methods for the solution of the fundamental equations of fluid dynamics. • Confrontation with complex problems in fluid dynamics. • To become acquainted with different, widely used CFD models that are used to study complex problems in fluid dynamics. • Ability to apply these CFD models to certain defined problems and to critically evaluate the results of numerical models. <p>Computerorientierte Physik Extension and complement of qualification in theoretical physics through the acquisition of solid and deep knowledge of advanced concepts and methods in theoretical physics. Depending on the selected course the students acquire knowledge in the fields of basis numerical methods of theoretical physics, algorithms and data structures in scientific computing, code debugging. They obtain skills for a confident application of modern methods of theoretical physics such as diagram generation, Molecular Dynamics and Monte Carlo simulations and quantitative analysis of advanced problems of theoretical physics and in further development of the physical intuition. They enhance their competences to effectively deal with sophisticated problems of theoretical physics, to independently develop approaches to current issues of theoretical physics, and to comprehend common concepts and methods of theoretical physics and the natural sciences, in general.</p> <p>Modelling and Simulation The students attending successful the course acquire an advanced understanding of the conceptual design of models in the field of engineering sciences. Special emphasis is on identifying the significant physical processes and the choice of the most efficient modelling type. The interaction of numerical simulations with field measurements and laboratory measurements including the theory of similarity will be discussed. To meet the needs of renewable energy, laser technology, environmental sciences and marine sciences the practical focus is on the modelling and simulation of fluid dynamics in small scales and close to structures.</p>
Module contents	<p>Computational Fluid Dynamics (CFD I & II)</p> <ul style="list-style-type: none"> • CFD I: The Navier-Stokes equations, filtering / averaging of Navier-Stokes equations, introduction to numerical methods, finite-differences,

finite-volume methods, linear equation systems, NS-solvers, RANS, URANS, LES, DNS, turbulent flows, incompressible flows, compressible flows, efficiency and accuracy.

- CFD II: Introduction to different CFD models, such as OpenFOAM and PALM. Application of these CFD models to defined problems from rotor aerodynamics and the atmospheric boundary layer.

Computerorientierte Physik

- Debugging
- Data structures
- Algorithms
- Random number generation
- Data analysis
- Percolation
- Monte Carlo simulation
- Finite size scaling
- Quantum Monte Carlo
- Molecular dynamics simulations
- Event-driven simulations
- Graphs and algorithms
- Genetic algorithms
- optimization problems

Modelling and Simulation

- Understanding of advanced fluid dynamics including three-dimensional, transient and compressible processes
- Identifying the significant physical processes, defining the dimensionality and relevant scales in time and space
- Theory of similarity, range of dimensionless numbers
- Potential Theory
- Numerical Algorithms and possibilities of independent coding of simplest mathematical models
- Limitations of numerical models, risk of empirical approaches included in numerical models
- Introduction of a complete chain of Open-Source-CFD-Tools, considering preprocessing, processing and postprocessing tools
- Need and availability of appropriate measurement techniques for the steering, calibration and verification of models
- Contactless high-resolving measuring techniques in the fluid dynamics
- Limits of accuracy of different modelling and simulation concepts

Prerequisites				
Skills to be acquired in this module	<p>The course in Advanced Metrology sets up a high level route enabling the students to acquire skills to allow them to operate effectively in the majors of Engineering Physics. This is achieved by provision of state-of-the-art technical and physical approaches covering broad aspects of advanced metrology within the context of Laser&optics, Biomedical physics & acoustics, and renewable energies.</p> <p>Demonstrate systematic knowledge across appropriate advanced metrology technologies, management and environmental issues to provide solutions for international industries and/or research organisations</p>			
Module contents	<p>The module combines theory and practical applications of the fundamentals of metrology in all majors.</p> <ul style="list-style-type: none"> • Fundamentals of Metrology • Dimensional Measurement Systems • Basic metrology operators including Association and Filtration. • Optical Metrology and Instrumentation • Surface and Nanometrology • Machine Tool and Large Volume Metrology • Process Measurement and Control • Individual Project

phy640 - Seminar Advanced Topics in EP

Module label	Seminar Advanced Topics in EP	
Modulkürzel	phy640	
Credit points	3.0 KP	
Workload	90 h (Attendance: 28 hrs, Self study: 62 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Pflichtmodule 	
Zuständige Personen	<ul style="list-style-type: none"> • Neu, Walter (module responsibility) • Herráez, Iván (Prüfungsberechtigt) • Neu, Walter (Prüfungsberechtigt) • Koch, Sandra (Prüfungsberechtigt) 	
Prerequisites	Participation: 1st -3rd semester. Presentation: Master thesis work in progress or finished; at least one successfully completed specialization module.	
Skills to be acquired in this module	The students are enabled to demonstrate the ability to communicate clearly, both orally and in writing, to specialist and non-specialist audiences. Demonstrate knowledge, fundamental understanding and critical awareness of current research fields in the student's master projects. Personal development through practice of communication, presentation, time management, teamwork, problem solving, project management, critical evaluation, numeracy, and IT skills.

Prerequisites	Acc. selected course			
Skills to be acquired in this module	<p>This module aims to raise the students understanding of the strategic, leadership, and technical aspects of project management and their role in adding competitive advantage to any enterprise. Concepts and techniques for programme and project management are introduced, developed and applied, with the aid of relevant case material.</p> <p>The students learn to consider specific key instrument types in current usage. This will be delivered in a project study format with each instrument being evaluated in terms of operating principle, design, and signal processing.</p>

Prerequisites	Sound knowledge in the specialisation field of Master thesis
Skills to be acquired in this module	Students are able to search for and to state an adequate research problem in the field of the working group or industry (problem should be related to the topics covered in the masters programme). They are capable to derive

research questions based on the statement of the problem and prepare an elaborated research proposal yielding lab work that serves as the preliminary study for the Master's Thesis.

Students are in a position to develop the specialised bases (detailed theoretical background of the topic, ample and critically annotated literature review, research objectives and research question(s), fully developed methods section, sketched workplan) of the Master's Thesis Project in terms of content and style in such a way that they form a sound basis for a successful Master's Thesis.

Students gain expertise in workflow optimization, data collection and data analysis. Independent management and transformation of a complex and unpredictable problem from the general field of study contexts of the Master degree program "Engineering Physics" (including related subject areas) utilizing scientific state-of-the-art research methods.

Module contents	Independent research for the definition of a physics and engineering solution to a problem in the chosen field. Specialized knowledge of a subject area as foundation for the student's research. The assignment of specific tasks will be given after consulting the responsible lecturers and is depending upon the current research profile. The Advanced research project (preliminary study to the Master's thesis) forms the basis of the Master's Thesis Project and must contain the following aspects: - Detailed theoretical background of the topic - Ample and critically annotated literature review - Research objectives and research question(s) - Fully developed methods section - Draft of a fully formed table of contents

Advanced Physics

phy602 - Advanced Nuclear & Particle Physics

Module label	Advanced Nuclear & Particle Physics	
Modulkürzel	phy602	
Credit points	6.0 KP	
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Advanced Physics 	
Zuständige Personen	<ul style="list-style-type: none"> • Poppe, Björn (module responsibility) • Drolshagen, Gerhard (Prüfungsberechtigt) • Poppe, Björn (Prüfungsberechtigt) • Looe, Hui Khee (Prüfungsberechtigt) 	
Prerequisites	Basic lectures in physics / engineering	
Skills to be acquired in this module	<p>High-Energy Radiation Physics: Basic understanding of the physical basics of high-energy radiation physics (in the energy sector from approx. 106 eV). Students should understand the universal approaches of the physical description of the generation, acceleration, interaction and detection of high-energy radiation across disciplines.</p> <p>Space Environment: Basic understanding of the main components of the near-Earth space environment. The students shall become familiar with die different types of radiation and particles in space, their physical characteristics and their effects on hardware and humans in space. The interdisciplinary nature of these topics shall become clear.</p>	
Module contents	<p>High-Energy Radiation Physics: Fundamentals of high-energy radiation physics, types of radiation in the environment, cosmos and medicine, cosmic rays, fundamentals of astroparticle physics, terrestrial and cosmic accelerators, interaction of radiation with matter, detection mechanisms and dosimetry, technical realizations for acceleration and detection.</p> <p>Space Environment: Overview of radiation and particles in space and their energy ranges. The upper Earth atmosphere, the spectrum of the sun and its variability, plasma, solar-terrestrial interactions, the radiation belts of Earth, cosmic rays, meteoroids and meteors, near-Earth objects, space debris. Effects and potential protection measures.</p>

Zuständige Personen	<ul style="list-style-type: none"> • Teubner, Ulrich (module responsibility) • Teubner, Ulrich (Prüfungsberechtigt) 	
Prerequisites	Electrodynamics	
Skills to be acquired in this module	The students acquire broad theoretical and experimental knowledge of optics together with the necessary physical background. In the laboratory they acquire practical skills during application of their knowledge from lecture. The module prepares the students to work in the field of optical science and engineering in general, and yields the base for all further specialisations within the field of optics and laser technology.	
Module contents	Fundamental and advanced concepts of optics. Topics include: reflection and refraction, optical properties of matter, polarisation, dielectric function and complex index of refraction, evanescent waves, dispersion and absorption of light, Seidel's aberrations, Sellmeier's equations, optical systems, wave optics, Fourier analysis, wave packets, chirp, interference, interferometry, spatial and temporal coherence, diffraction (Huygens, Fraunhofer, Fresnel), focussing and optical resolution, brilliance, Fourier optics, optics at short wavelengths (extreme UV and X-rays)	
Literatureempfehlungen	Born and Wolf: Principles of Optics (Cambridg Press); E. Hecht: Optics (Addison-Wesley); Pedrotti and Pedrotti: Introduction to Optics (Prentice- Hall); Saleh and Teich, Fundamentals of Photonics (Wiley); all those books are also available in German

phy617 - Fourier Methods

Module label	Fourier Methods
Modulkürzel	phy617
Credit points	6.0 KP
Workload	180 h (Attendance: 56hrs, Self Study: 124 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none">• Master's Programme Engineering Physics (Master) > Advanced Physics
Zuständige Personen	<ul style="list-style-type: none">• Teubner, Ulrich (module responsibility)• Teubner, Ulrich (Prüfungsberechtigt)• Silies, Martin (Prüfungsberechtigt)
Prerequisites	
Skills to be acquired in this module	

Physics with ultrashort pulses:

Students will get competences on the special aspects on ultrashort laser pulses which do not play a role in standard optics or laser physics. Starting from basics, the module yields advanced knowledge of the physics of femtosecond light pulses and their interaction with matter, as well as the physics of femtosecond lasers. The students will obtain skills to work with such lasers, in particular, on generation, handling, measurement, application of femtosecond pulses.

Fourier methods:

The students acquire deeper knowledge on Fourier mathematics and its applications within physics. They will learn related definitions, properties, theorems. Many examples will be presented. The students should be able to apply Fourier technology for physical and technical problems, in particular with relation of spatial and temporal domain to (spatial) frequency domain. They will get deepened insight on physical procedures by analysis within frequency domain.

Module contents

The course consists of two parts, both strongly related to Fourier physics:

1) Physics with ultrashort pulses:

Linear and non-linear optics of ultrashort pulses such as: amplitude, phase and spectral phase of the electric field, chirp, phase and group velocity, dispersion, group velocity dispersion, pulse compression, self focusing, self phase modulation, frequency conversion, multi photon effects; femtosecond laser pulse generation and amplification with various schemes, measurement of ultrashort pulses; applications

2) Fourier methods:

Motivation: Application of Fourier transformation within physics. Examples of Fourier pairs; properties of Fourier transformation; symmetries; important theorems; displacement, differentiation, convolution, uncertainty relation; examples to convolution theorem, frequency comb, Hilbert transformation, auto correlation function methods of time/frequency analysis, Wigner distribution; Fourier transformation in higher dimensions: tomography; discrete Fourier transformation, sampling theorem; applications

Prerequisites	Statistics, Computing		
Skills to be acquired in this module	Students should understand current high-throughput methods used in research and clinics. They should be aware of the advantages and challenges and should be able to judge and interpret the results. In addition, the students should accomplish a sound understanding of basic algorithms which are used to analyze big and complex data sets. They should be able to choose, use and interpret appropriate tools and methods. Finally, students should be able to address the limitations and prospects of big-data analyses in complex systems.		
Module contents	The lecture aims to provide an overview about current experimental high-throughput methods and bioinformatic algorithms to address the challenges of exponentially growing amounts of data. In addition to basic algorithms and methods like alignments, hidden markov models, Viterbi, graphs or protein-protein interaction networks, the lecture aims to give an introduction to a data-driven view of disease biology

Prerequisites	Basic signal processing, algebra knowledge	
Skills to be acquired in this module	This course introduces basic concepts of statistics and signal processing and applies them to real-world examples of bio-medical data. In the second part of the course, recorded datasets are noise-reduced, analyzed, and discussed in views of which statistical tests and analysis methods are appropriate for the underlying data. The course forms a bridge between theory and application and offers the students the means and tools to set up and analyze their future datasets in a meaningful manner.	
Module contents	Normal distributions and significance testing, Monte- Carlo bootstrap techniques, Linear regression, Correlation, Signal-to-noise estimation, Principal component analysis, Confidence intervals, Dipole source analysis, Analysis of variance Each technique is explained, tested and discussed in the exercises.

Prerequisites	
Skills to be acquired in this module	

5.04.4242:

Neben den aktuellen Themen der Strahlenphysik erlernen die Studierenden den Umgang mit meist englischsprachigen Fachzeitschriften aus dem Bereich. Darüber hinaus werden Präsentationstechniken durch eigene Vorträge erlernt. Parallel zu der Veranstaltung wird die Verwendung eines Monte-Carlo Strahlungstransport-Codes (EGS) erlernt und somit die Fähigkeit vertieft, komplexe physikalische Modelle in eine Software umzusetzen.

5.04.4642:

Der Kurs vermittelt die Fähigkeit zum Verständnis grundlegender Anwendungen der Strahlenphysik in der Medizin. Die Studierenden erweitern somit ihre Kompetenzen im Hinblick auf die Bewertung fächerübergreifender Zusammenarbeit unterschiedlicher Disziplinen. Sie erlernen zudem den selbständigen Umgang mit fremdsprachlicher Literatur.

Module contents

5.04.4242:

Aktuelle Themen aus der Medizinischen Strahlenphysik

wie: IMRT, NMR, PET, SPECT usw.;

5.04.4642:

Grundlagen der Strahlentherapie, Dosimetrie, Einführung

in die Strahlentherapie, Wechselwirkung von Strahlung

mit Materie, Elektronen, Photonen und Teilchenstrahlung,

mathematische Beschreibung von Dosisverteilungen in Absorbern, Detektoren und dosimetrische Protokolle, Grundlagen der Bestrahlungsplanung sowie Brachytherapie.

phy632 - Spectrophysics

Module label	Spectrophysics	
Modulkürzel	phy632	
Credit points	6.0 KP	
Workload	180 h (Attendance: 28 hrs, Self study: 62 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Laser and Optics 	
Zuständige Personen	<ul style="list-style-type: none"> • Neu, Walter (module responsibility) • Koch, Sandra (Prüfungsberechtigt) • Neu, Walter (Prüfungsberechtigt) • Schellenberg, Markus (Prüfungsberechtigt) 	
Prerequisites	Atomic and Molecular Physics, Optical systems	
Skills to be acquired in this module	Students gain in depth theoretical as experimental knowledge on advanced optical spectroscopy applied to atomic and molecular systems. They are qualified in setting up innovative methods and measurement devices based on their expert competence in up-to-date research and development areas. The module prepares the students to work in the field of optical science and engineering in general, and yields the base for all further specialisations within the field of optics and laser technology.	
Module contents	Atomic structure and atomic spectra, molecular structure and molecular spectra, emission and absorption, width and shape of spectral lines, radiative transfer and transition probabilities, elementary plasma spectroscopy, experimental tools in spectroscopy, dispersive and interferometric spectrometers, light sources and detectors, laser spectroscopy, nonlinear spectroscopy, molecular spectroscopy, time resolved spectroscopy, coherent spectroscopy

Prerequisites	Basics in optics and laser physics, in particular, fundamentals of optics and photonics; atomic and molecular physics; spectrophysics			
Skills to be acquired in this module	The students thoroughly deepen their knowledge on concepts of spectroscopy as well as on biophotonics. This module provides the theoretical background for analytical applications involving UV-Visible spectroscopy, atomic absorption, emission and laser based spectroscopies. The students develop a sound understanding of the principles and instrumentation of atomic and molecular spectroscopy with in depth applications to a wide range of environments e.g. analytical, biological, industrial, pharmaceutical, environmental. The students develop problem solving skills with reasoning based on theory underlying spectroscopy and photonics in biosciences and medicine thus providing a background to practical laboratory training.			
Module contents	Application of atomic and molecular spectroscopy at a wide range of fields, e.g. industrial, biosciences, microscopy, pharmaceutical, environmental, trace analysis: 1. Explain the mechanisms of and fundamental distinctions between molecular and atomic spectroscopy 2. Recognise the issues regarding sensitivity and selectivity of molecular and atomic spectroscopy 3. Evaluate the limitations and analytical issues associated with each method 3. Demonstrate analytical application of these atomic and molecular absorption and emission techniques 4. Discriminate the analytical challenges that can be appropriately solved by these spectroscopic techniques

Prerequisites	Knowledge in physics, optics, production engineering		
Skills to be acquired in this module	Fundamental knowledge of the characteristics of the laser beam, Knowledge of laser sources for industrial applications, knowledge of procedures of the material processing with laser beams Knowledge of the physical-technical procedures of the individual manufacturing processes with laser beams; Ability for the estimation of favorable working parameters; The participants should be able to understand the procedures of the material processing with laser beams and evaluate the tasks of manufacturing.		
Module contents	Overview of the interactions between laser beams and materials in laser material processing. Allocation of the processes in relation to production technology with the laser beam as a tool. Intensive treatment of the manufacturing processes with laser beams in terms of quality, speed and costs. The processes of cutting, joining, surface treatment and generative manufacturing are dealt with intensively using examples from industrial production. Within the framework of lecture-accompanied project work, the application technologies are processed, optimized and evaluated by the students in the laser laboratory.

Zuständige Personen	<ul style="list-style-type: none">• Lehnhoff, Sebastian (module responsibility)• Lehrenden, Die im Modul (Prüfungsberechtigt)
Prerequisites	No participant requirements
Skills to be acquired in this module	<p>After successful completion of the course the students should be able to understand the existing structures and technical basis of energy systems to produce, transfer and distribute electricity and their interaction and dependency on each other. They should have developed an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems. The students are able to estimate and evaluate the requirements and challenges of ICT and computer science which are caused by the development and integration of unforeseeable fluctuations of decentralised plants. The students will be able to estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems. Regarding the requirements the students will be able to analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems.</p> <p>Professional competence The students:</p> <ul style="list-style-type: none">• understand the existing structures and the technical basis of energy systems producing, transferring and distributing electricity and their interaction and dependency on each other.• develop an understanding for necessary IT- and process control technology components, methods and processes to control and operate electrical energy systems.• estimate and evaluate the requirements and challenges of ICT and computer science which are caused by the development and integration of unforeseeable fluctuations of decentralised plants.• estimate the influence of distributed control concepts and algorithms for decentralised plants and consumers in the so called Smart Grid energy systems. <p>Methodological competence The students:</p> <ul style="list-style-type: none">• analyse the safety, reliability, realtime capability and flexibility of Smart Grid energy systems• use advanced mathematical methods to calculate networks <p>Social competence The students:</p> <ul style="list-style-type: none">• create solutions in small teams• discuss their solutions <p>Self-competence The students:</p> <ul style="list-style-type: none">• reflect their own use of electricity as a limited resource
Module contents	Content of the Module: In this course information technology, economical energy industry and technical basic knowledge and methods are analysed by

using concrete Smart Grid approaches. The basic calculation methods for an intelligent grid management are introduced. This module deals with the technical and economical framework for a permissible electrical network as well as mathematical modelling and calculation methods to analyse conditions of electrical energy networks (in stationary conditions).
These are:

- The organisation of the EU energy market (regulatory framework, responsibility in liberalisation of electrical energy systems)
- Establishment and operation of electrical energy supply networks (network topology, statutory duties of supply, supply quality/system services, malfunctions and protection systems)
- Network calculation (complex vector representation, effective/idle power, mathematical performance models/net model, transformation: node performance to node voltage and electricity, calculation of conductive current, current flow, fix-point-iteration, Newton-Raphson-Method, voltage drop, transformer model)
- Intelligent network management (Smart Grids), aggregation forms, machine learning approaches)

Prerequisites	Solid-state-Physics, semi-conductor Physics, Module Renewable Energy Technologies I				
Skills to be acquired in this module	describe schematically the events around the pn-junction under bias in the dark and under illumination, calculate the width of the space charge region, use solar cell data sheets in their professional career, discuss the concepts of solar cell materials, design and optimization, choose a PV technology for a given project				
Module contents	This specialization module covers the physics of photovoltaics. The behaviour of solar cells is discussed from a fundamental physical point of view to explain the differences in performance and limits of various photovoltaic materials. Students learn how solar cells function, are designed and optimized, Optical and electrical properties of semiconductors, light absorption, Charge carrier generation/recombination/life time, Charge carrier transport across the pn-junction in equilibrium and under light and voltage bias, Transport equations, Current-voltage characteristics, efficiency, Quantum efficiency, Design concepts to optimize the efficiency, Overview of the most important PV technologies

Workload Präsenzzeit	56 h	

phy646 - Wind Physics Student's Lab

Module label	Wind Physics Student's Lab
Modulkürzel	phy646
Credit points	6.0 KP
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies
Zuständige Personen	<ul style="list-style-type: none"> • Schmidt, Andreas Hermann (Prüfungsberechtigt) • Kühn, Martin (module responsibility)
Prerequisites	Basic computer knowledge; mechanics; mathematical methods for physics and engineering; basic knowledge of wind energy utilization; previous knowledge of metrology, basic knowledge of aerodynamics
Skills to be acquired in this module	<p>The "Wind Physics Student's Lab" aims to foster the learning process by own research activities of the students in wind physics and additionally to build up skills for scientific and experimental work and scientific writing. Therefore, this course is also intended as preparation for the master thesis.</p> <p>The course is organized as seminar with integrated work in the laboratory. The students will investigate an individual, self-formulated research question and will be guided by the supervisors through the research-based learning process. The work in groups and discussion of solutions aims to improve skills in team working. In order to introduce the students to current wind energy research, the course is offered in three versions. These versions represent the work of the three research groups at ForWind - University Oldenburg.</p>
Module contents	<p>Content of Wind2Grid-Seminar</p> <p>The seminar consists of three main phases with different learning steps:</p> <p>1st phase:</p> <p>Class-room seminar building up basic competences</p> <ul style="list-style-type: none"> identification of the technical tasks introduction to current research introduction to the learning platform investigating standard situations and functional interaction by means of the experimental system defining an own research question defining an experimental strategy planning the experiment <p>2nd phase: Laboratory work (1 week)</p> <ul style="list-style-type: none"> set-up, execution, data acquisition and decommissioning of the experiment <p>3rd phase: Evaluation and documentation evaluating the experiment</p> <p>documentation with a short report (paper) presentation</p> <p>The seminar "Wind turbine rotor in turbulent inflow" is connected to the scientific work of the research group Turbulence, Wind Energy and Stochastics (TWIST).</p> <p>In this seminar, turbulent wind fields and their effects on wind turbines will be investigated. Students learn how turbulence can be described, investigated and evaluated for different purposes. The students gain a deep understanding of the phenomenon of turbulence. They learn to work with measured data from the open field and perform own experiments with an active turbulence grid and a model of a wind turbine in a turbulent wind tunnel. They learn to establish their own research questions and are encouraged to develop own methods. The seminar consists of three main phases with different learning steps:</p> <p>1st phase: Class-room seminar</p> <ul style="list-style-type: none"> - building up basic competences - identification of the technical and/or scientific tasks - introduction to current research - introduction to the experiment related to the seminar <ul style="list-style-type: none"> • investigating standard situations and functional interaction by means of the experimental system • defining own research questions • defining an experimental strategy • planning the experiment <p>2nd phase: Laboratory work</p>

- set-up, execution, data acquisition and decommissioning of the experiment

3rd phase: Evaluation and documentation

- evaluating the experiment
- documentation with a short report (paper)
- presentation

phy649 - Design of Wind Energy Systems

Module label	Design of Wind Energy Systems
Modulkürzel	phy649
Credit points	6.0 KP
Workload	180 h (Attendance: 72 hrs, Self study: 108 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies • Sustainable Renewable Energy Technologies (Master) > Mastermodule
Zuständige Personen	<ul style="list-style-type: none"> • Kühn, Martin (module responsibility) • Kühn, Martin (Prüfungsberechtigt) • Schmidt, Andreas Hermann (Prüfungsberechtigt)
Prerequisites	Basics in Wind Energy Utilisation
Skills to be acquired in this module	<p>Design of Wind Energy Systems: The students attending the course will have the possibility to expand and sharpen of their knowledge about wind turbine design from the basic courses. The lectures include topics covering the whole spectrum from early design phase to the operation of a wind turbine. Students will learn in exercises how to calculate and evaluate design aspects of wind energy converters. At the end of the lecture, they should be able to:</p> <ul style="list-style-type: none"> estimate the site specific energy yield, calculate the aerodynamics of wind turbines using the blade element momentum theory, model wind fields to obtain specific design situations for wind turbines, estimate the influence of dynamics of a wind turbine, especially in the context of fatigue loads, transfer their knowledge to more complex topics such as simulation and measurements of dynamic loads, calculate the economic aspects of wind turbine <p>Aeroelastic Simulation of Wind turbines: student who has met the objectives of the course will be able to:</p> <ul style="list-style-type: none"> understand the basic concept of an aero-servo-elastic computer code to determine the unsteady aerodynamic loads, derive and validate the required parameters to model the aero-hydro-elastic response of a wind turbine, identify and interpret the required empirical parameters to correct the blade element momentum (BEM) method with respect to dynamic in flow, unsteady airfoil aerodynamics (dynamic stall), yawed flow, dynamic wake modeling, explain the effects of the different models on the resulting time series and validate the code, interpret design standards for on- and offshore wind turbines, select the required load cases according to sitespecific environmental data, identify the dimensioning load cases and calculate design loads for different main components of a wind turbine.
Module contents	<p>Design of Wind Energy Systems Introduction to industrial wind turbine design, rotor aerodynamics and Blade Element Momentum (BEM) theory, dynamic loading and system dynamics, wind field modelling for fatigue and extreme event loading, design loads and design aspects of onshore wind turbines, simulation and measurements of dynamic loads, design of offshore wind turbines, power quality and grid integration on wind turbines.</p> <p>Aeroelastic Simulation of Wind turbines: The course focuses on the practical implications and hands-on experience of the aero-hydro-servo-elastic modelling and simulation of wind turbines. The subjects are similar but the treatment is complementary to the parallel course 'Design of Wind Energy Systems', which deals with the underlying theoretical background: advanced wind field modelling for fatigue and extreme event loading, modelling of wind farm flow and wake effects, rotor aerodynamics (e.g. stationary or dynamic effects, comparison of Blade Element Momentum theory and more advanced methods like free vortex methods or CFD), structural dynamics and dynamic modelling of wind turbine structures (modelling by ordinary or partial differential equations, stochastics, multi body system modelling), advanced control of wind turbines, design standards, design loads and design aspects of off-shore and onshore wind turbines. The students analyse in pairs a model of an entire wind turbine with the aid of a typical wind turbine design tool like GH Bladed, Flex5 or</p>

Aerodyn/FAST.

phy987 - Control of Wind Turbines and Wind Farms

Module label	Control of Wind Turbines and Wind Farms
Modulkürzel	phy987
Credit points	6.0 KP
Workload	180 h (Attendance: 72 hrs, Self study: 108 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none">• Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies• Sustainable Renewable Energy Technologies (Master) > Mastermodule
Zuständige Personen	<ul style="list-style-type: none">• Kühn, Martin (module responsibility)• Kühn, Martin (Prüfungsberechtigt)• Petrovic, Vlaho (Prüfungsberechtigt)
Prerequisites	Wind Energy Utilization (Bachelor) or Wind Energy Physics (Master) or Basics of Wind Energy (Master SURE) and Design of Wind Energy Systems (can be attended in parallel)
Skills to be acquired in this module	

After successful completion of the course, students

- will have understood the structure and the main components of the control system in a wind farm
- will have understood the main objectives for a wind farm control system and will be able to develop appropriate control algorithms for the said objectives
- will have understood relevant physical phenomena in a wind farm
- will be able to develop a control-oriented model of a wind turbine, and will have understood how to use it for the design and analysis of control algorithms
- will be able to independently apply different techniques from control engineering
- will have trained how to use methods from linear algebra and mathematical analysis for the design and analysis of control algorithms

Module contents

The course covers the main techniques used in wind turbine and wind farm control. The course is structured in five sections:

Section I: Introduction to control in wind energy

- Introduction to the governing physics
- Control objectives in wind energy
- Overview of the control system

Section II: Control oriented modelling

- Modelling in time domain
- Modelling in frequency domain
- Time and frequency response

Section III: Standard wind turbine control

- Torque and pitch control
- Tuning of a PI controller
- Stability analysis
- Control of coupled systems

Section IV: Advanced wind turbine control

- Advanced control design approaches
- State space control
- Estimation techniques

Section V: Wind farm control

- Wake control strategies
- Active power control
- Power maximization

Prerequisites		
Skills to be acquired in this module	Students acquire the competence to plan, execute, analyze, document and present complex and advanced physical experiments. They deepen their experience in working with state-of-the-art measurement and analyzing equipment within the field of Experimental Physics applied in the field of renewable Energy. The Adv. Labs are research oriented.	
Module contents	Each student performs 3 labs selected from a pool of labs addressing advanced measurement techniques and equipment represented in the Renewable Energy research work of various research groups at the Institute of Physics. The pool includes topics on material analysis, optical measurement techniques and state-of-the-art technologies.

Zuständige Personen	<ul style="list-style-type: none">• Agert, Carsten (module responsibility)• Torio, Herena (module responsibility)• Torio, Herena (Prüfungsberechtigt)• Knipper, Martin (Prüfungsberechtigt)• Gütay, Levent (Prüfungsberechtigt)
Prerequisites	
Skills to be acquired in this module	

After successful completion of the module students should be able to:

- understand, describe and compare major technologies for solar energy use: solar thermal and photovoltaic systems
- analyse various system components and their interconnections within a solar energy system.
- critically appraise and assess various technologies for solar energy use and components involved in such solar systems.
- size and evaluate the performance of solar systems as a function of their operation conditions, components and system layout
- critically evaluate non-technical impact and side effects when implementing renewable energy supply systems

Module contents

This module gives an overview on renewable energy heat and photovoltaic technologies. Main focus hereby are the scientific principles of components and their technical description as well as first suitable system performance assessment methods.

Photovoltaics (Lecture: 90 h workload)

- Basic and most important properties of solar radiation related to photovoltaics
- PV cells basics: Fundamental physical processes in photovoltaic materials
- Characterization and basic modelling of solar cells
- Component Description: PV generator; Charge controller; Inverter; Balance of system components; System Description
- Grid Connected System
- Stand Alone System

Renewable Energy Heat (Seminar & Exercises: 90 h workload)

- Assessment of solar thermal ambient parameters: regional global,

- diffuse, reflected solar radiation on horizontal and on tilted plane, ambient temperature
- Solar thermal system components: collectors; heat exchangers; thermal storage; thermal driven compression chillers
- Solar cooling systems and components
- Characterization of solar thermal systems, their operation and performance
- F-Chart and Utilizability methods as main methods for assessing system performance

pre113 - Photovoltaic Systems

Module label	Photovoltaic Systems
Modulkürzel	pre113
Credit points	6.0 KP
Workload	180 h (180 Stunden)
Verwendbarkeit des Moduls	<ul style="list-style-type: none">• Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies• Sustainable Renewable Energy Technologies (Master) > Mastermodule
Zuständige Personen	<ul style="list-style-type: none">• Agert, Carsten (Prüfungsberechtigt)• Knipper, Martin (Prüfungsberechtigt)• Knipper, Martin (module responsibility)• Agert, Carsten (module responsibility)
Prerequisites	
Skills to be acquired in this module	

After successful completion of the module students should be able to:

- categorize and feature different PV systems
 - o PV on-grid,
 - o PV off-grid / stand alone,
 - o PV-pumping,
 - o PV-hybridby their setup and by standard quality indicators.
- explain the operation principles of the listed PV systems
- explain concepts behind PV system design
- design a photovoltaic system by Fermi Estimate
- design a photovoltaic system by a simulation software
- be aware of the limitation of both design methods
- discuss energy flow diagrams of PV systems
- describe in depth involved balance of system components e.g.
 - o inverter,
 - o charge controllers
 - o cabling
 - o generator stand

storage battery with a focus on housing (ventilation)

Module contents

This specialization module covers more in-depth topics concerning photovoltaics systems.

The module consists of:

Photovoltaic Systems Lecture (90h workload)

Description and operation of PV System's balance of system components

- o inverter,
- o charge controllers
- o cabling
- o generator stand
- o storage battery with a focus on housing (ventilation)

Quality indicators for PV Systems and their regional differences

- o PV on-grid,
- o PV off-grid / stand alone,
- o PV-pumping,
- o PV-hybrid

Sizing of PV systems – back of the envelope approach as well as by a simulation software

Photovoltaic Systems Seminar (90h workload)

Within the seminar groups of up to five students select a PV system related research question, work on the solution and present their findings.

In addition, external PV experts are invited to present from their work experience.

An excursion to a PV power plant concludes the lessons learned in the field.

pre114 - Solar Energy Meteorology

Module label	Solar Energy Meteorology
Modulkürzel	pre114
Credit points	6.0 KP
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)
Verwendbarkeit des Moduls	<ul style="list-style-type: none">• Master's Programme Engineering Physics (Master) > Schwerpunkt: Renewable Energies• Sustainable Renewable Energy Technologies (Master) > Mastermodule
Zuständige Personen	<ul style="list-style-type: none">• Torio, Herena (module responsibility)• Agert, Carsten (module responsibility)• Schmidt, Thomas (Prüfungsberechtigt)• Lezaca Galeano, Jorge Enrique (Prüfungsberechtigt)
Prerequisites	Successful participation in "Energy Meteorology 5.06.M117"
Skills to be acquired in this module	

After successful completion of the module students should be able to

- explain the concepts of physical processes governing the surface solar irradiance available for solar energy applications
- model the solar radiation and show their expertise in application, adaptation and development of models
- discuss state-of-the-art-methods in satellite-based irradiance estimation and solar power forecasting
- discuss and present state of the art of the application of modern solar energy meteorology on a wide range (from residential systems to solar power plants, from solar thermal to photovoltaic systems)

Module contents

This specialization module covers more in-depth topics concerning solar energy meteorology.

Based on students' knowledge about the solar resource, solar thermal and photovoltaic technology, students deepen their knowledge on the resource for such systems.

Lecture

- Physics of radiative processes in the atmosphere
- Physical modelling of atmospheric radiative transfer (incl. computing tools)
- Solar irradiance modelling for solar energy applications
- Solar spectral irradiance: Theory and relevance for solar energy systems
- Satellite-based estimation of solar irradiance
- Solar irradiance (and solar power) forecasting
- Solar radiation measurements: Basics and setup of high quality measurement system

Seminar

- sources of solar data and discussion of their quality
- solar resource assessment:
- basic models,
- measurements,
- satellite models
- data sets
- validation and application of solar resource data sets
- forecasting of solar radiation: sky-camera forecasts, satellite-based forecasts, numerical weather predictions, statistical methods
- forecast validation
- selected applications
- irradiance and PV power forecasting
- application of solar resource data for yield assessment

Prerequisites	Fluid Dynamics I	
Skills to be acquired in this module	Deeper understanding of the fundamental equations of fluid dynamics. Overview of numerical methods for the solution of the fundamental equations of fluid dynamics. Confrontation with complex problems in fluid dynamics. To become acquainted with different, widely used CFD models that are used to study complex problems in fluid dynamics. Ability to apply these CFD models to certain defined problems and to critically evaluate the results of numerical models.	
Module contents	<p>CFD I: The Navier-Stokes equations, filtering / averaging of Navier- Stokes equations, introduction to numerical methods, finite- differences, finite-volume methods, linear equation systems, NS-solvers, RANS, URANS, LES, DNS, turbulent flows, incompressible flows, compressible flows, efficiency and accuracy.</p> <p>CFD II: Introduction to different CFD models, such as OpenFOAM and PALM. Application of these CFD models to defined problems from rotor aerodynamics and the atmospheric boundary layer.</p>

phy605 - Digital Signal Processing

Module label	Digital Signal Processing	
Modulkürzel	phy605	
Credit points	6.0 KP	
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Acoustics 	
Zuständige Personen	<ul style="list-style-type: none"> • Doclo, Simon (module responsibility) • Doclo, Simon (Prüfungsberechtigt) 	
Prerequisites		
Skills to be acquired in this module	The students acquire knowledge about theoretical concepts and methods of signal processing and system theory for discrete-time signals and systems. The students are able to apply these theoretical concepts and methods in analytical, numerical and programming exercises.	
Module contents	System properties (stability, linearity, time-invariance, causality); Discrete-time signal processing: sampling theorem, time-domain analysis (impulse response, convolution), z-transform, frequency-domain analysis (transfer function, discrete-time Fourier transform, discrete Fourier transform, FFT, STFT), digital filter design (FIR, IIR, linear phase filter, all-pass filter, signal flow graph), multi-rate signal processing (down/up-sampling, filter banks); Statistical signal processing: stationarity, ergodicity, correlation, Wiener-Khinchin theorem, spectral estimation; Adaptive filters: optimal filters, Wiener filter, time-domain algorithms (RLS, NLMS), frequency-domain algorithms (FDAF); Matlab exercises about discrete-time signal processing and adaptive filters.	
Literaturempfehlungen	<p>A. V. Oppenheim, R. W. Schaffer, "Discrete-Time Signal Processing", Prentice Hall, 2013.</p> <p>J. G. Proakis, D. G. Manolakis, "Digital Signal Processing – Principles, Algorithms and Applications", Prentice Hall, 2013.</p> <p>S. Haykin, "Adaptive Filter Theory", Pearson, 2013.</p> <p>P. P. Vaidyanathan, "Multirate systems and filter banks", Prentice Hall, 1993.</p> <p>K.-D. Kammeyer, K. Kroschel, "Digitale Signalverarbeitung: Filterung und Spektralanalyse mit MATLAB Übungen", Broschiert, 2018</p>

Prerequisites	Introductory signals and systems lecture	
Skills to be acquired in this module	The students will be able to (a) explain the foundations of speech production, perception and analysis, (b) understand the mathematical and information-theoretical principles of speech signal processing, and (c) apply the studied methods to explain the working principle of practical speech processing systems.	
Module contents	Speech production and perception, speech analysis, speech signal processing (STFT, LPC, cepstrum, speech enhancement), speech coding, speech synthesis, automatic speech recognition, speech quality and intelligibility measures, selected topics on speech processing research.	
Literaturempfehlungen	<p>M. R. Schroeder, Computer Speech: Recognition, Compression, Synthesis, Springer, 2013.</p> <p>J. R. Deller, J. H. L. Hansen, J. G. Proakis: Discrete-Time Processing of Speech Signals, Wiley-IEEE Press, 1999.</p> <p>P. Vary, R. Martin: Digital Speech Transmission, Wiley, 2006.</p> <p>J. Benesty, M. M. Sondhi, Y. Prerequisites	Introductory acoustics lecture	
Skills to be acquired in this module	The students acquire knowledge about advanced concepts in acoustics, electro-acoustics, room acoustics, acoustical measurement methods and virtual acoustics. The students acquire skills to critically and independently apply these concepts and methods to acoustical problems.	
Module contents	Acoustical measurement methods (sound pressure, spectrum, transfer function, intensity); Non-linear measurement methods (Hammerstein model); Inverse problems in acoustics and regularization; High-resolution methods, acoustic camera; Binaural virtual acoustics; Spherical harmonics, virtual acoustics (Ambisonics, Wave Field Synthesis); Transaural systems; Room acoustics simulation.

phy694 - Machine Learning II

Module label	Machine Learning II	
Modulkürzel	phy694	
Credit points	6.0 KP	
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Acoustics 	
Zuständige Personen	<ul style="list-style-type: none"> • Lücke, Jörg (module responsibility) • Lücke, Jörg (Prüfungsberechtigt) 	
Prerequisites	<p>The course requires the introductory course "Machine Learning - Probabilistic Unsupervised Learning" or equivalent courses. Furthermore, basic knowledge in higher Mathematics as taught as part of first degrees in Physics, Mathematics, Statistics, Engineering or Computer Science (basic linear algebra and analysis) is required. Additionally, programming skills are required (the course supports matlab and python). Many relations to statistical physics, statistics, probability theory, stochastic exist but the course's content will be developed independently of detailed prior knowledge in these fields.</p>	
Skills to be acquired in this module	<p>The students will deepen their knowledge on mathematical models of data and sensory signals. Building up on the previously acquired Machine Learning models and methods, the students will be lead closer to current research topics and will learn about models that currently represent the state-of-the-art. Based on these models, the students will be exposed to the typical theoretical and practical challenges in the development of current Machine Learning algorithms. Typical such challenges are analytical and computational intractabilities, or local optima problems. Based on concrete examples, the students will learn how to address such problems. Applications to different data will teach skills to use the appropriate model for a desired task and the ability to interpret an algorithm's result as well as ways for further improvements. Furthermore, the students will learn interpretations of biological and artificial intelligence based on state-of-the-art Machine Learning models.</p>	
Module contents	<p>This course builds up on the basic models and methods introduced in introductory Machine Learning lectures. Advanced Machine Learning models will be introduced alongside methods for efficient parameter optimization. Analytical approximations for computationally intractable models will be defined and discussed as well as stochastic (Monte Carlo) approximations. Advantages of different approximations will be contrasted with their potential disadvantages. Advanced models in the lecture will include models for clustering, classification, recognition, denoising, compression, dimensionality reduction, deep learning, tracking etc. Typical application domains will be general pattern recognition, computational neuroscience and sensory data models including computer hearing and computer vision.</p>	
Literatureempfehlungen	<p>Pattern Recognition and Machine Learning, C. M. Bishop, Springer 2006. (best suited for lecture).; Information Theory, Inference, and Learning Algorithms, D. MacKay, Cambridge University Press, 2003. (free online)</p>

phy696 - Advanced Topics Speech and Audio Processing

Module label	Advanced Topics Speech and Audio Processing	
Modulkürzel	phy696	
Credit points	6.0 KP	
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)	
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Acoustics 	
Zuständige Personen	<ul style="list-style-type: none"> • Doclo, Simon (module responsibility) • Doclo, Simon (Prüfungsberechtigt) • Gerkmann, Timo (Prüfungsberechtigt) 	
Prerequisites	Basic principles of signal processing (preferably successfully completed the course Signal- und Systemtheorie and/or Blockpraktikum Digitale Signalverarbeitung)	
Skills to be acquired in this module	The students will gain in-depth knowledge on the subjects' speech and audio processing. The practical part of the course mediates insight about important properties of the methods treated in a self-study approach, while the application and transfer of theoretical concepts to practical applications is gained by implementing algorithms on a computer.	
Module contents	After reviewing the basic principles of speech processing and statistical signal processing (adaptive filtering, estimation theory), this course covers techniques and underlying algorithms that are essential in many modern-day speech communication and audio processing systems (e.g. mobile phones, hearing aids, headphones): acoustic echo and feedback cancellation, noise reduction, dereverberation, microphone and loudspeaker array processing, active noise control. During the exercises a typical hands-free speech communication or audio processing system is implemented (in Matlab).

phy960 - Psychoacoustics

Module label	Psychoacoustics			
Modulkürzel	phy960			
Credit points	6.0 KP			
Workload	180 h (Attendance: 56 hrs, Self study: 124 hrs)			
Verwendbarkeit des Moduls	<ul style="list-style-type: none"> • Master's Programme Engineering Physics (Master) > Schwerpunkt: Acoustics 			
Zuständige Personen	<ul style="list-style-type: none"> • van de Par, Steven (module responsibility) • van de Par, Steven (Prüfungsberechtigt) 			
Prerequisites	Introductory acoustics lecture			
Skills to be acquired in this module	The students acquire knowledge about concepts and methods in auditory perception, psychoacoustics, subjective test design, and auditory scene analysis. The students acquire skills to apply these concepts and methods in practice (e.g. sound quality measurement, signal processing algorithms).			
Module contents	<p><i>Applied psychophysics</i></p> <p>Subjective listening experiment design and models of human auditory perception will be treated with a focus on application in sound quality measurement (e.g. for vehicle noise and sound reproduction) and in digital signal processing algorithm development (e.g. for low bit-rate audio coding and headphone virtualizers).</p> <p><i>Auditory Scene Analysis in Speech and Music</i></p> <p>Basic principles of auditory scene analysis: sequential and simultaneous segregation, schema-based segregation; scene analysis in music perception: the cocktail party problem, speech intelligibility in complex acoustic environments, hearing loss, and experimental methods; speech and music perception with hearing aids and cochlear implants</p>			
Literatureempfehlungen	<p>H. Fastl, E. Zwicker: Psychoacoustics: Facts and Models, Springer, 2007.</p> <p>A.S. Bregman: Auditory Scene Analysis, MIT press, 1990.</p> <p>P. Damaske: Acoustics and Hearing, Springer, 2008.</p>

Prerequisites	Master Curriculum Engineering Physics
Skills to be acquired in this module	<p>As a general objective for the Master Thesis, the student shall demonstrate the ability to constructively, critically and independently formulate, discuss and communicate issues at stake, integrating theory and methodology.</p> <p>As specific competency objectives within the Master Thesis, after completion the student shall be able to:</p> <ul style="list-style-type: none">- demonstrate knowledge of relevant and latest publications concerning the selected topic- elaborate the Master Thesis on the basis of clearly formulated, general objectives and specific characteristics of the topic- identify and put to use in an operational manner empirical or other scientific material and methods that are appropriate in relation to the subject- develop a balanced discussion of material, methods, results and possible consequences of these in relation to the field of Renewable Energy- present the Master Thesis orally and defend the results and conclusions in a critical discussion <p>The module is designed to apply and deepen the methodologies acquainted throughout the program to a specific scientific problem given by the supervisor. In order to achieve a result the student needs to apply scientific as well as keycompetencies described in the next section.</p> <p>Students have understood the scientific problem, they have learned the ropes of the problem, they have selected, acquainted or deepened a set of scientific and methodologies and key-competencies necessary to solve the problem and they have applied those methods.</p>
Module contents	<p>The master thesis module finalizes and concludes the master programme. The student presents the achieved results as a written thesis and defends the results / conclusions to a board of examiners.</p> <p>Within this framework, the students work independently on a current topic from</p>

the research areas of the working groups. The work is accompanied by a seminar to present and review results and the progress of the work intermittently. The results will be presented and defended in a final colloquium. The publication of thesis results is appreciated.
