# Akzentsetzungsmodule

## inf100 - Human Computer Interaction

Module label	Human Computer Interaction
Modulkürzel	inf100
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Business Informatics (Master) &gt; Akzentsetzungsmodule der Informatik</li><li>• Master's Programme Computing Science (Master) &gt; Praktische Informatik</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Embedded Brain Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Human-Computer Interaction</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Boll-Westermann, Susanne (module responsibility)</li><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li></ul>
Prerequisites	Useful previous knowledge: Interactive Systems
Skills to be acquired in this module	<p>With the help of suitable resources, the students can design, prototype, and evaluate a human-machine interface following the user-centered design process (HCD).</p> <p><b>Professional competence</b> The students:</p> <ul style="list-style-type: none"><li>• can describe and explain the HCD process.</li><li>• can classify an unknown method into the HCD process when they are presented with a brief description.</li><li>• can select a suitable prototyping approach for a given application.</li><li>• can select a suitable prototyping method for a given application.</li><li>• can apply selected prototyping methods to create an interactive system.</li><li>• can name basic characteristics of human perception and motor skills and explain their importance for the development of interactive systems.</li><li>• can suggest and motivate improvement for a given user interface based on the gestalt laws.</li><li>• can explain the characteristics of human visual search and utilize it to improve given interfaces.</li><li>• can critically compare several variants of an interactive system's concept based on the "Multiple Resource Theory".</li></ul> <p><b>Methoden competence</b> The students:</p> <ul style="list-style-type: none"><li>• can critically compare and select methods for context of use and/or user requirements analysis.</li><li>• can apply methods for context of use and/or user requirements analysis to a real-world example.</li><li>• can retrospectively discuss and evaluate the use of a method for context of use and/or user requirements analysis.</li><li>• can plan, moderate and evaluate an ideation session.</li><li>• can formulate a precise research question based on a given problem description.</li><li>• can discuss the advantages and disadvantages of an experiment design.</li><li>• can select a suitable experiment design for a given research question.</li><li>• can define hypotheses and null hypotheses for a given experiment.</li></ul> <p><b>Social competence</b> The students:</p> <ul style="list-style-type: none"><li>• can work out solutions for a given design problem in group work.</li><li>• can present solutions to design problem in the plenum.</li><li>• can motivate their methodical approach to a design problem.</li></ul>

- can discuss their designs and results in an appropriate and professional manner with the plenum.
- can accept criticisms by their peer group as valuable contributions to their designs.

**Self-competence:**

The students:

- can accept and learn from mistakes made during the design process.

**Module contents**

The module covers research methods in the field of human-computer interaction. It discusses the core principles of human-computer interaction and the human-centered design process and its phases, context of use, requirements, and task analysis, prototyping and evaluation. Research methods used in the different phases of the process are introduced and discussed.

Available design options for human-machine interfaces are presented and discussed with regard to human perception capabilities and their limitations. The module discusses methods for user research, including surveys, diaries, case studies, interviews, and focus groups, as well as physiological measurements.

The module goes into further detail on evaluation methods, and introduces the foundations of experimental research in human-computer interaction, including types of research, research hypotheses, experimental design, and statistical analysis.

During the practical project, a concrete human-computer interface will be designed, developed and evaluated.

## inf300 - Hybrid Systems

Module label	Hybrid Systems
Modulkürzel	inf300
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Computing Science (Master) &gt; Technische Informatik</li><li>• Master's Programme Computing Science (Master) &gt; Theoretische Informatik</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Embedded Brain Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Systems Engineering</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Fränzle, Martin Georg (module responsibility)</li><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li></ul>
Prerequisites	
Skills to be acquired in this module	

The module gives an introduction to hybrid discrete-continuous systems, as arising by embedding digital hardware into physical environments, and it elaborates on state of the art methods for the mathematical modelling and the analysis of such systems. It thus provides central competences for understanding and designing reliable cyber-physical systems.

### Professional competence

The students:

- characterise formal models of cyber-physical systems: hybrid automata, hybrid state transition systems
- name domain-specific system requirements: safety, stability, robustness
- name analysis methods: symbolic state-space exploration, abstraction and abstraction refinement, generalized Lyapunov-Methods
- use state-of-the-art analysis tools
- select and apply adequate modelling and analysis methods for concrete application scenarios
- apply methods to reduce large state spaces and reduce infinite-state systems by abstraction
- know the de-facto industry standards for system modelling and are able to apply the corresponding modelling frameworks and tools

### Methodological competence

The students:

- model heterogeneous dynamical systems with adequate modelling and design tools, in particular Simulink/Stateflow
- transfer modelling and analysis methods to other heterogeneous domains, e.g. socio-technical systems

### Social competence

The students:

- work in teams
- solve complex modelling, design, and analysis tasks in teams

### Self-competence

The students:

- reflect their actions and respect the scope of methods dedicated to hybrid systems

---

### Module contents

Embedded computer systems continuously interact with their environment, which generally comprises state- and time-continuous components. The coupling of the embedded system to its environment thus induces complex interleavings between discrete computational and decision processes and continuous processes. The resulting processes are neither amenable to the analytic techniques of continuous control nor of discrete mathematics. They instead require a broader, integrated theory: hybrid discrete-continuous systems. The lectures provide an in-depth introduction into a variety of analysis

and design methods of these computer-based systems and their recent extensions to cyber-physical systems The accompanying hands-on-project enhances the lecture by developing and using design and verification tools.

<b>Prerequisites</b>	No participant requirements			
<b>Skills to be acquired in this module</b>	<p>The module provides practical relevance to the design of digital embedded systems.</p> <p><b>Professional competence</b> The students:</p> <ul style="list-style-type: none"> <li>• characterise the structure of microprocessor systems</li> <li>• name control aspects of time sensitive external components</li> <li>• program efficient embedded systems</li> </ul> <p><b>Methodological competence</b> The students:</p> <ul style="list-style-type: none"> <li>• use specifications from electrical components data sheets</li> </ul> <p><b>Social competence</b> The students:</p> <ul style="list-style-type: none"> <li>• work in a team</li> <li>• discuss solutions</li> </ul>			
<b>Module contents</b>	<p>Embedded systems support complex feedback problems, control problems and data processing tasks. They have an important value creation potential for telecommunications, production management, transport and electronics. The functionality of embedded systems is realised by the integration of processors, special hardware and software. The embedded systems design is influenced by the heterogeneity of system architectures, the complexity of systems and technical and economic requirements. This module gives an initial review of computer architectures. After that embedded systems are introduced by a specific microprocessor. Furthermore, external hardware will be connected to the microprocessor. Besides this, the design of circuit boards will be discussed. The students will design, develop and implement a circuit layout with CAD and programme this embedded system with a Flash-eprom.</p>

## inf303 - Fuzzy Control and Artificial Neural Networks in Robotics and Automation

Module label	Fuzzy Control and Artificial Neural Networks in Robotics and Automation
Modulkürzel	inf303
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Computing Science (Master) &gt; Angewandte Informatik</li><li>• Master's Programme Computing Science (Master) &gt; Technische Informatik</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Embedded Brain Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Human-Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Systems Engineering</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Fatikow, Sergej (module responsibility)</li><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li></ul>
Prerequisites	No participant requirements
Skills to be acquired in this module	<p>Experts in different branches try to approach their application-specific control and information processing problems by using fuzzy logic and artificial neural networks (ANN). The experiences gathered up to now prove robotics and automation technology to be predestined fields of application of both these approaches. The major topics of the course are control problems in robotics and automation technology, principles of fuzzy logic and ANN and their practical applications, comparison of conventional and advanced control methods, combination of fuzzy logic and ANN in control systems. The course gives a comprehensive treatment of these advanced approaches for interested students.</p> <p><b>Professional competence</b> The students:</p> <ul style="list-style-type: none"><li>• recognise control problems in robotics and automation technology,</li><li>• name principles of fuzzy logic and ANN and their practical applications,</li><li>• compare conventional and advanced control methods, - characterise the combination of fuzzy logic and ANN in control systems</li></ul> <p><b>Methodological competence</b> The students:</p> <ul style="list-style-type: none"><li>• will acquire knowledge of the tools, methods and applications in fuzzy logic and ANN</li><li>• deepen their knowledge for the practical use of the given methods</li><li>• can use common software tools for design and application of fuzzy logic and ANN</li></ul> <p><b>Social competence</b> The students:</p> <ul style="list-style-type: none"><li>• gain experience in interdisciplinary work</li><li>• are integrated into the recent research work Objective of the module / skills:</li></ul> <p><b>Self-competence</b> The students:</p> <ul style="list-style-type: none"><li>• are able to transfer the gained knowledge for later use in their theses or studies for AMiR</li><li>• can Design (complex) fuzzy logic controller and ANN systems</li><li>• reflect their (control) solutions by using methods learned in this course</li></ul>
Module contents	<ul style="list-style-type: none"><li>• Control problems in robotics and automation technology</li></ul>

- Basic ideas of fuzzy logic and ANN
- Principles of fuzzy logic
- Fuzzy logic of rule-based systems
- ANN models
- ANN learning rules
- Multilayer perceptron networks and backpropagation
- Associative networks
- Self-organizing feature maps
- PID design principles
- Design of fuzzy control systems

---

### Skills to be acquired in this module

Professional competence  
The students:

- Describe medical diagnosis and therapy methods
- Understand the core concepts of computer-assisted medical interventions
- Are aware of the basic concepts and legal conditions of the development of medical devices
- Define the character of medical devices' software parts and implement them
- Assess the complex interaction of medical products and patients
- Get familiar with the development of medical products within a short period of time

#### Methodological competence

The students:

- Recognise the interdisciplinary challenges and accordingly exchange information with other disciplines

#### Social competence

The students:

- Present solutions for specific questions

#### Self-competence

The students:

- reflect their solutions by using methods learned in this course

---

### Module contents

- Medical areas and areas of application
- Basic requirements for medical systems (hygiene, MPG, technical security, materials)

Medical systems:

- Functional diagnostics (ECG, EMG, EEG)
- Imaging systems (CT, MRI, ultrasound, PET, SPECT)
- Therapy equipment (Laser, RF, Microtherapy)
- Signal processing / monitoring (cardiovascular, hemodynamic, respiratory, metabolic, cerebral)
- Medical Informatics (HIS, DICOM, Telemedicine, VR, image)

processing).

## inf308 - Microrobotics II

Module label	Microrobotics II
Modulkürzel	inf308
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Computing Science (Master) &gt; Interdisziplinäre Module</li><li>• Master's Programme Computing Science (Master) &gt; Technische Informatik</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Embedded Brain Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Human-Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Systems Engineering</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Fatikow, Sergej (module responsibility)</li><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li></ul>
Prerequisites	Microrobotics and Microsystems Engineering

---

### Skills to be acquired in this module

After having given an established introduction in the module "Microrobotics and Microsystem Technology" this lecture offers a further specialisation in microrobotics. Within the course, all relevant areas (among others the research topics of the division "Microrobotics and Control Engineering (AMiR)") will be presented and analysed. The student will be provided with an insight into current research projects of AMiR and of other research institutes of microrobotics worldwide; here mainly the requirements of industry to microrobots will be discussed. The lecture will be enhanced by practical courses in the research laboratories of AMiR.

#### Professional competence

The students:

- name and recognise the basic concepts of nanotechnology, in particular, micro- and nanorobotics approaches
- differentiate the development, control and application of micro- and nanorobotics systems - implement and design application-specific micro- and nanorobotics systems

#### Methodological competence

The students:

- transfer their control engineering and image processing abilities on interdisciplinary problems
- transfer their hands-on experience to develop controls and applications of microrobotic systems on new tasks

#### Social competence

The students:

- work in a team

#### Self-competence

The students:

- reflect their problem-solving behaviour and use hands-on experience to develop, control and application of microrobotics

---

### Module contents

- Smart and versatile microrobots; microactuators (piezo-, ferrofluid- and SMA-actuators) for microrobots;
- real-time image processing in the micro world (SEM, optical microscopy);
- micro force sensors and tactile sensors for microrobots;
- microrobot control systems, e.g. neural networks and fuzzy logic;
- haptic interface for the control of microrobots;

- neural speech interface for the control of microrobots;
- robot-based micro- and nanohandling (SEM, optical microscopy);
- applications: microassembly, nano-testing, cell handling;
- Micro Air Vehicles (MAVs); multi-robot systems: team behavior, communication, control issues

#### Literaturempfehlungen

- Lecture notes (can be obtained in secretariate, A1-3-303)
- Fatikow, Sergej (Ed.): Automated Nanohandling by Microrobots, Springer, London, 2008

## inf311 - Low Energy System Design

Module label	Low Energy System Design
Modulkürzel	inf311
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Computing Science (Master) &gt; Technische Informatik</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Embedded Brain Computer Interaction</li><li>• Master's Programme Engineering of Socio-Technical Systems (Master) &gt; Systems Engineering</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Rauh, Andreas (module responsibility)</li><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li></ul>
Prerequisites	
Skills to be acquired in this module	

This module introduces the estimation of power dissipation and optimisation.

### Professional competence

The students:

- Discuss the fundamental problems of power dissipation
- Characterise the requirements-driven design process of embedded systems
- Name power loss analysis and optimization methods
- Design embedded systems with common design and analysis tools
- Design power-optimized embedded systems

### Methodological competence

The students:

- Model systems with a hardware description language
- Analyze and model hardware components
- Perform multi-dimensional optimization of systems

### Social competence

The students:

- Implement solutions of given problems in teams
- Discuss their outcomes appropriately

### Self-competence

The students:

- Acknowledge the limits of their ability to cope with pressure during the modeling process of systems

---

## Module contents

According to Moore's Law the number of integratable transistors on a computer chip doubles every two years. In addition, new circuits are getting faster and faster. This leads not only to an increased functionality of a system, but it also increases the electrical power consumption. This electrical power consumption is problematic from two different points of view: Firstly, the electrical power must be supplied. Secondly, the resulting heat has to dissipate from the system. An increased power consumption always causes lower battery life and higher energy costs. The heat generation reduces the reliability and life of integrated circuits. The cooling (ceramic housings, cooling elements, fans, etc. ) increases the system's costs. Today the development of heat, caused by power dissipation, needs to be considered during the embedded system design process. This knowledge takes the system's reliability and operation costs into account. This module introduces the estimation of power dissipation and optimisation.

---

### Module contents

The course addresses a research trend in formal methods, the combination and integration of different specification methods. It focuses on a concrete combination CSP-OZ of the specification techniques CSP (Communicating Sequential Processes) for processes and Z and Object-Z for data, respectively. Reactive systems are described by CSP-OZ. As a preparation, the specification languages Z and CSP are described, followed by the combination CSP-OZ with its process-oriented semantics. The concepts of refinement and inheritance and the possibility of automatic verification of a sublanguage of CSP-OZ with the FDR model checker for CSP will be discussed. Finally, the course explains possibilities of extending CSP-OZ for the specification of time-critical systems.

#### Topics:

- specification of complex data and operations in Z, type definition and pattern calculations of Z, data refinement
- specifications of communicating processes in CSP, operational semantics of CSP, three abstract semantic models for CSP: Trace semantics, failures semantics, failures-divergences semantics, process refinement in the above semantics, FDR model checker for CSP
- combined specification method CSP-OZ, transformational semantics as CSP-process, theorems of refinements, object-oriented concepts of class and inheritance in CSP-OZ

### Skills to be acquired in this module

Introduction to Milner's Calculus of Communicating Systems (CCS) and the  $\lambda$ -Calculus.

#### Professional competence

The students:

- know the theory of the operational semantics of CCS and the  $\lambda$ -calculus
  - Perform equivalence proofs using simulations and bisimulations
- specify communicating and mobile systems with CCS and the  $\lambda$ -calculus

#### Methodological competence

The students:

- learn about different views on mobility
- recognize equivalences as formal means for system correctness

#### Social competence

The students:

- work together in small groups to solve problems
- present their solutions to groups of other students

#### Self-competence

- The students:
  - learn persistence in pursuing difficult tasks
  - learn precision in specifying problems

---

### Module contents

Communication is one of the basic concepts of computer science. It occurs between computers in a network as well as between components of a computer. The focus of the course is on Robin Milner's  $\lambda$ -calculus. It enables a new modelling of communication, taking the location of the communication into account. The  $\lambda$ -calculus can describe the change of data in a computer as well as the sending of messages or even programs along networks like the internet. It is also possible to describe reconfigurable networks. This will be shown using the examples of mobile phones, schedulers, automatic vending machines, data structures, communication protocols, and objects in object-oriented programming. All these applications are backed by the theory of the  $\lambda$ -calculus, which is based on operational semantics and a concept of behavioural equivalence. The theory will be explained in a step-by-step manner.

#### Topics:

- different views on mobility
- transition systems with simulations and bisimulations
- Milner's Calculus of Communicating Systems (CCS) and Milner's  $\lambda$ -calculus for mobile systems, both with operational semantics, structural congruence, strong equivalence and observational equivalence, relationship between reactions and transitions, solvability of recursive equations
- formal specification of examples of communicating and mobile systems

- using CCS and the  $\lambda$ -calculus
- proof of strong equivalence and observational equivalence of given processes
- specification of dynamic data structures in the  $\lambda$ -calculus

### Module contents

Examples of time-critical systems are railway control systems, robots, or even gas burners. It is essential for these systems to comply with certain timing conditions. For example, the control of a railway crossing must close the gates not later than 4 seconds after the sensors have reported an approaching train. If the gates are open, they should stay that way for at least 15 seconds to allow for a safe crossing of vehicles. Different specification methods have been developed to describe such timing conditions. The Duration Calculus developed by Zhou Chaochen in 1991 is one attractive method. It is a logic combined with a calculus, in which the duration of states can be described. The course will introduce the Duration Calculus and will explain its application by means of examples. As further specification method Timed Automata introduced by Alur & Dill in 1994 will be presented. After the specification of real-time system requirements the verification of programs implementing these requirements will follow. The specification methods of the Duration Calculus and Timed Automata are used to describe the real-time behaviour of these programs. The correctness is then proven on the basis of these behavioral descriptions.

#### Topics:

- discrete and continuous model of time
- logics and automata models for the specification of real-time systems

- (predicate logic, Duration Calculus, Timed CTL, Timed Automata, PLC-Automata)
- decidability and undecidability results for real-time systems
  - model checker UPPAAL for Timed Automata
  - formal specification of real-time systems using Duration Calculus as well as Timed Automata and PLC-Automata
  - verification of concrete Timed Automata using the model checker UPPAAL,
  - transformation of Duration Calculus for discrete time into regular languages
  - implementability of real-time systems on PLC-like hardware

## inf513 - Energy Informatics Lab

Module label	Energy Informatics Lab
Modulkürzel	inf513
Credit points	6.0 KP
Workload	180 h
Verwendbarkeit des Moduls	<ul style="list-style-type: none"><li>• Master's Programme Business Informatics (Master) &gt; Akzentsetzungsmodule der Informatik</li><li>• Master's Programme Computing Science (Master) &gt; Angewandte Informatik</li></ul>
Zuständige Personen	<ul style="list-style-type: none"><li>• Lehrenden, Die im Modul (Prüfungsberechtigt)</li><li>• Lehnhoff, Sebastian (module responsibility)</li></ul>
Prerequisites	<ul style="list-style-type: none"><li>• Programming with Java</li><li>• Programming with Python</li></ul>
Skills to be acquired in this module	<p>Successfully completing this lecture will enable the students to mathematically model simple controllable electrical generators and consumers and to simulate them together with appropriate control algorithms within smart grid scenarios. To achieve this goal, students will start with deriving computational models from physical models and evaluate them. In order to manage the integration of control algorithms, students are taught the principles of cosimulation using the "mosaik" smart grid co-simulation framework as an example. Students will be able to understand and apply distributed, agent-based control schemes to decentralized energy generators and/ or consumers. As a result, students are able to analyze the requirements for successful application to real power balancing regarding capacity utilization, robustness, and flexibility. In addition, students learn the foundations of planning and conducting simulation based experiments as well as the interpretation of the results. Special attention will be paid on establishing a balance between the results' precision and robustness and the necessary effort (design of experiments) in order to gain as much insight into interdependencies with as few experiments as possible.</p> <p><b>Professional competence</b> The students:</p> <ul style="list-style-type: none"><li>• derive and evaluate computational models from physical models</li><li>• use the "mosaik" smart grid co-simulation framework</li><li>• analyze the requirements for successful applications to real power balancing regarding capacity utilization, robustness, and flexibility</li><li>• name the foundations of planning and conducting simulation based experiments as well as the interpretation of the results</li><li>• are aware of the balance between the results' precision and robustness and the necessary effort (design of experiments) in order to gain as much insight into interdependencies with as few experiments.</li></ul> <p><b>Methodological competence</b> The students:</p> <ul style="list-style-type: none"><li>• model simple controllable electrical generators and consumers</li><li>• simulate simple controllable electrical generators and consumers with appropriate control algorithms within smart grid scenarios</li><li>• apply distributed agent-based control schemes to decentralized energy generators and/ or consumers</li><li>• evaluate simulation results</li><li>• search information and look into methods to implement models</li><li>• propose hypothesis and check their validity with design of experiments methods</li></ul> <p><b>Social competence</b> The students:</p> <ul style="list-style-type: none"><li>• apply the pair programming development technique</li><li>• discuss design decisions</li><li>• identify work packages and are responsible for it</li></ul> <p><b>Self-competence</b> The students:</p> <ul style="list-style-type: none"><li>• reflect on their own use of power as a limited resource</li><li>• accept and use criticism to develop their own behaviour</li></ul>

---

## Module contents

In this practical course students:

- model controllable, modulating electrical energy generators and consumers,
- put their hands on mosaik (installation, description and configuration of scenarios, conduction of simulations),
- learn the principles of agent-based heuristics for optimization problems in future smart grid scenarios,
- learn about the challenges of implementing agent-based mechanisms (multi-criticality, convergency, quality) on the training,
- learn the foundations for choice and design of simulation based experiments.

#### Skills to be acquired in this module

The module aims to integrate current developments in the field of Practical Informatics into the course of study in the appropriate course forms.

#### Subject competences

The students:

- differentiate and contrast a subarea of practical computer science in more detail
- recognize and assess the techniques and methods to be applied in the special field of the course and their limits
- identify, structure and solve problems also in new or emerging areas of their discipline
- recognize the limits of current knowledge and technology and contribute to the further scientific and technological development of computer science
- discuss current developments in practical computer science and assess their significance
- critically follow further developments in the special field discussed in the course.

#### Methodological competencies

The Students:

- apply state-of-the-art and innovative methods in the research and solution of problems, drawing on other disciplines where appropriate
- investigate problems on the basis of technical and scientific literature,
- write an article according to scientific criteria, and present their results in a scientific talk
- reflect on problems, including those in new or emerging areas of practical computer science, and apply computer science methods to investigate and solve them
- plan time schedules and other resources
- develop and reflect on their own theories on independently generated hypotheses

#### Social Skills

The Students:

- will communicate persuasively orally and in writing with users and professionals
- will solve tasks goal-oriented in a team

#### Self-competencies

The students:

- deepen their self-organization skills
- reflect self-critically on their actions and skills in the special field under consideration and assess them appropriately

---

#### Module contents

---

In this module, content and methods on current topics in practical computer science are taught.

For details on objectives and contents, please refer to the details of the assigned course or contact the lecturers directly

Prerequisites	

No participant requirements

---

### Skills to be acquired in this module

This module integrates current developments in the field of Digitalised Energy Systems in adequate study courses.

#### Professional competences

The students:

- define and contrast a computer science part, in which they are specialised, in detail or
- evaluate computer science in general
- recognise and evaluate applied techniques and methods of their subject and are aware of their limits
- identify, structure and solve problems/tasks, also in new or developing subject areas
- apply state of the art and innovative methods to solve problems, if necessary from other disciplines
- are aware of the current limits and contribute to the development of computer science research and technology
- discuss and evaluate recent computer science developments

#### Methodological competences

The Students:

- evaluate tools, technologies and methods
- sophisticatedly combine new and original approaches and methods
- creatively evaluate problems/tasks, including new or developing subject areas of their discipline
- apply computer science methods for solutions and research

#### Social competences

The Students:

- support team process by their abilities

#### Self-competences

The Students:

- pursue the overall and special computer science development
- critically implement innovative professional activities effectively and independently
