

Modulhandbuch Microbiology - Master-Studiengang

Datum 15.10.2019

Mastermodule

mar500 - Physiology and diversity of microorganisms

Modulbezeichnung	Physiology and diversity of microorganisms
Modulcode	mar500
Kreditpunkte	12.0 KP
Workload	360 h
Verwendet in Studiengängen	<ul style="list-style-type: none"> Master Microbiology (Master) > Mastermodule
Ansprechpartner/-in	<p>Modulverantwortung</p> <ul style="list-style-type: none"> Bert Engelen <p>Modulberatung</p> <ul style="list-style-type: none"> Lehrende der Mikrobiologie
Teilnahmevoraussetzungen	
Kompetenzziele	The students know the cells of pro- und eukaryotes. They understand the basic mechanisms of microbial metabolism. They know the physiological and phylogenetic groups of prokaryotes, eukaryotic microorganisms and viruses. They have an overview over applied aspects of microbiology.
Modulinhalte	<p>Lecture + Exercises: Physiology and Life modes of Prokaryotes: Cellular and subcellular organization, assimilation and dissimilation, energy metabolism, transport, microbial growth, respiration, chemiosmotic theory, fermentation, anaerobic respiration, lithotrophy, photosynthesis, prokaryotic diversity, systematics and taxonomy, Archaea, Bacteria, Eukarya, pathogenic prokaryotes, evolution, microbiological techniques</p> <p>Lecture + Exercises: Microbial Diversity The eukaryotic cell, diversity, systematics and taxonomy of prokaryotes and eukaryotic microorganisms , algae, protozoa, fungi, slime molds, phagocytosis, symbioses, pathogenic eukaryotes, diversity of eukaryotic microbes, components of viruses, virus reproduction, bacteriophages, diversity of viruses, virus diseases</p> <p>Broadening lectures, one out of the following lectures: - Biological significance of suspended matter) - Sediment Microbiology</p> <p>This lecture presents state of the art knowledge about occurrence, life and activities of microorganisms in these environments. Physiological issues are addressed as well as evolutionary and applied aspects. Topics are:</p> <ul style="list-style-type: none"> Formation, diagenesis and special features of sediments physico-chemical conditions and geological records interpretation of gradients microbes and biological processes in sediments methods for cultivation of sediment organisms molecular methods biogeochemical methods quantification of prokaryotes and viruses <p>(Teacher: Engelen; Form of study/semester periods per week: 4 week block, 2 lectures per week, Presence: 16 hours, private study: 74 hours; Credits: 3; 2nd Semester, Learning target/competences: Physico-chemical conditions, microbial processes and methods of studying these processes in sediments)</p> <p>Broadening Seminar: Scientific writing and presentation The students know the importance and structure of scientific publications. They have learned to critically read those, and know the requirements of different parts. They are trained to to give oral presentations and know how to produce scientific reports and posters. They know how to use the library and how to find relevant literature on the internet, and how to use data banks like Endnote. They have learned how to present themselves for an application.</p> <p>Seminar Scientific writing and presentation: - Types and relevance of scientific publications - Parts of scientific publications step by step: - Abstract, Introduction, Results, Discussion - University facilities for literature search - Oral presentation - How to prepare posters - Tips for using PowerPoint, Word and Endnote - Job application</p> <p>(Courses: Seminar (2 SPPW, 3 CP); Teachers: Engelen; Work load: Presence: 30 hours, private study: 60 hours; Passing criteria: Oral presentation or discussion of parts of scientific papers) - alternative lectures of the MSc MUWI or Biology program (see current online schedule) Excursions to companies and scientific institutions</p>

Teilnahmevoraussetzungen	Lecture: Biological significance of suspended matter				
Kompetenzziele	<p>The students learn how to address scientific questions and to carry out experimental and/or field work in scientific projects guided by experienced researchers and PhD students. The projects are designed in the context of ongoing research on the ecology of bacterial communities in the water column, oxic sediments and associated to eukaryotic organisms. The students learn to apply various state of the art methods and approaches in aquatic microbial ecology and how to interpret data and results of the projects. They learn to write protocols in the structure of scientific papers and to present own results and reference studies to an audience.</p> <p>The students gain competences in how to design experiments and address specific research questions in aquatic microbial ecology and to choose appropriate methods. They obtain practical experience in project-targeted application of state of the art methods. This enables them to obtain a more critical view on the application of these and other methods and on the validity of scientific investigations in aquatic microbial ecology.</p>				
Modulinhalte	"Ecology of marine microbes": The students carry out small projects coming out of ongoing research of PhD Thesis work and other current research of the working group. Typically a group of two of three students is guided by a senior researcher and/or a PhD student. In the accompanying seminar, recent scientific studies published in international journals are presented by the students. The results are written down and discussed in a protocol fulfilling scientific level requirements.

mar580 - Profile Module Microbial ecology of marine sediments

Modulbezeichnung	Profile Module Microbial ecology of marine sediments			
Modulcode	mar580			
Kreditpunkte	6.0 KP			
Workload	180 h			
Verwendet in Studiengängen	<ul style="list-style-type: none"> • Master Microbiology (Master) > Mastermodule 			
Ansprechpartner/-in	Modulverantwortung <ul style="list-style-type: none"> ◦ Bert Engelen 			
Teilnahmevoraussetzungen	Lecture: Microbial ecology			
Kompetenzziele	The students know how to - sample marine sediments - characterize the cores sedimentologically and biogeochemically - collect and analyze porewater - determine total cell counts - quantify groups of organisms molecular biologically - cultivate different physiological groups of bacteria - present and discuss scientific results - write a scientific protocol			
Modulinhalte	<p>"Microbial ecology of marine sediments": The physiological diversity of microorganisms and their spatial distribution within marine sediments are demonstrated according to chemical and physical parameters. Different physiological groups are analysed along the sediment column of intertidal sandflat or beach. Sediment sampling is performed at the back barrier area of the island "Spiekeroog" at the beginning of the course. Oxygen penetration, porewater sulfate and methane concentrations are measured down to a depth of app. 5 meters. As microbiological parameters, total cell numbers are counted and the numbers of archaea and bacteria are calculated after quantitative PCR (qPCR). More specifically, the relative amounts of sulfate reducers and methanogens are also determined by qPCR targeting key-genes for sulfate reduction and methanogenesis. Furthermore, every single group of students will specifically enrich one physiological type of microorganisms from distinctive sediment layers. Microbial growth and activity are monitored over the whole period of the course.</p> <p>Accompanying the course, all participants will give a talk to introduce "their" physiological group concerning its ecology, physiology, and strategies for a specific enrichment. All the data and observations of the single groups will be combined at the end of the course to draw an overall picture of microbial diversity and the occurrence of the different physiological groups corresponding to relevant geochemical gradients.</p>

Ansprechpartner/-in	Modulverantwortung <ul style="list-style-type: none"> ◦ Bert Engelen 			
Teilnahmevoraussetzungen	Microbial Physiology and diversity (M1)			
Kompetenzziele	In this course the students will isolate bacteria and other microorganisms. They will learn classical microbiological techniques as enrichment culture, aseptic work, preparation of liquid and solid media, cultivation under oxic and anoxic condition, on agar plates and in deep agar dilution, description of microbes by techniques as staining, microscopy, microphotography.			
Modulinhalte	"Isolation and characterization of microorganisms": Seminar Prior to the laboratory work the participants shall read literature about first isolation, description and current studies on their target organisms and present this and their isolation strategy in the seminar. During the course and at the end, results and a possible molecular identification of isolates will be presented and discussed. Practical work: Every student prepares media and agar plates required for the isolation of the different target organisms. If pure cultures have been isolated, they should be transferred to long-term storage on agar and in liquid nitrogen. Sampling sites and different stages of the enrichment and isolation are documented by macro- and microphotography and described in the report. Finally, tests to verify purity of the culture and its identification, as well as a phylogenetic analysis are requested.

Teilnahmevoraussetzungen	Lecture: Organic chemistry			
Kompetenzziele	Students will learn about the chemical properties and major ecological roles of secondary metabolites, how to investigate the secondary metabolites of marine invertebrates and algae, how to analyze secondary metabolite profiles, how to isolate compounds of interest and how to conduct various bioassays to assess potential ecological roles of crude extracts and potentially isolated compounds. Students will also learn how to statistically evaluate their results.			
Modulinhalte	"Chemical Ecology": The course consists of lectures, followed by laboratory experiments. Students will research about various topics in marine chemical ecology. Laboratory work will include production of extracts from various invertebrates and algae. Extracts will be tested in various feeding assays to assess the chemical properties of extracts. Extracts will also be tested for antimicrobial activity with environmental strains. This includes the culture of test bacteria and antimicrobial assays. Final evaluation will be a laboratory report about the experiments. This will include statistical analysis of their experiments and discussion of their results in the framework of the lectures and seminars presented during the course.

mar621 - Profile Module Techniques in light microscopy and electron microscopy

Modulbezeichnung	Profile Module Techniques in light microscopy and electron microscopy				
Modulcode	mar621				
Kreditpunkte	6.0 KP				
Workload	180 h				
Verwendet in Studiengängen	<ul style="list-style-type: none"> • Master Microbiology (Master) > Mastermodule 				
Ansprechpartner/-in	Modulverantwortung <ul style="list-style-type: none"> ◦ Erhard Rhiel 				
Teilnahmevoraussetzungen	none				
Kompetenzziele	The students will learn - the basics/theory of scanning electron microscopy (SEM) and transmission electron microscopy (TEM) - different sample preparation methods for SEM - to operate our scanning electron microscope - to operate our critical point drying device - to perform sputter coating - to perform negative staining TEM - to operate our transmission electron microscope - to perform immuno-labelling for light microscopy				
Modulinhalte	The profile module "Techniques in light microscopy and electron microscopy" runs over a period of 10 days, distributed over three weeks. On the first day, seminars will introduce into the theory, i.e. of SEM and TEM. The remaining 9 days are for practice. The main topics of the course are: basic principles and functioning of light and electron microscopes, sample preparation, fixation, low temperature SEM, low vacuum SEM, negative staining TEM, and immuno-labelling for light microscopy.				
Literaturempfehlungen	will be announced

mar622 - Profile Module R programming for (meta)-genomic sequence analysis

Modulbezeichnung	Profile Module R programming for (meta)-genomic sequence analysis		
Modulcode	mar622		
Kreditpunkte	6.0 KP		
Workload	180 h		
Verwendet in Studiengängen	<ul style="list-style-type: none"> Master Microbiology (Master) > Mastermodule 		
Ansprechpartner/-in	Modulverantwortung <ul style="list-style-type: none"> Liliana Cristina Moraru Prüfungsberechtigt <ul style="list-style-type: none"> Liliana Cristina Moraru 		
Teilnahmevoraussetzungen	The course „Introduction in sequencing and sequence analysis“. Previous programming experience is not required.		
Kompetenzziele	DNA sequencing has become a routine method in microbiology research. Most of the times, sequence analysis requires knowledge of a programming language. One of the programming languages most used for this purpose is R. After successful participation the students will have the competence to understand, interpret and carry out simple genome sequence analyses. They will acquire transferable skills in using R		
Modulinhalte	The course will cover the following topics: <ol style="list-style-type: none"> programming in R using an integrated development environment (RStudio) working with strings (stringr package) working with lists and data frames (readr and dplyr package) sequence analysis (seqinr, Bioconductor packages: Biostrings, GenomicRanges, Decipher) (meta)-genomic and data visualization (ggplot2, Gviz) Creating sequence / metadata dabases Accessing and mining sequence / metadata databases though R based web applications (Shiny, DT and Shinyjs packages) reporting in R (Rmarkdown and Knitr packages) managing code (Roxygen2 package) microbial genome annotation using R. A single, introductory lecture will be offered within the first day of the course. Then, the course will be structured in programming exercises which cover all topics listed. The exercises are designed to exemplify the use R programming within the framework of microbial (meta)-genome analysis. In addition to the teacher–student sessions, the students will work on individual projects. Each student will receive a short microbial genome (e.g. viral genome), and will analyze it by building custom, self-programmed pipelines. The output from the individual projects will consist in an analysis report prepared in Rmarkdown and Knitr packages. The report will include both the R code and the genome analysis results.		
Literaturempfehlungen	will be announced
