pre373 - Control Techniques and Renewable Energy Integration Systems

Control Techniques and Renewable Energy Integration Systems

- Master's Programme European Master in Renewable Energy (EUREC) > Mastermodule

By the end of this module, students should be able to manage the theoretical and practical aspects related to power electronics, with an emphasis in the analysis of the operation of specific devices used to integrate RE. They should also be able to evaluate the requirements, design and optimise Micro Grids.

At the completion of this module, the student will:
- Become familiar with the AC/DC Drives control systems (multilevel converters, PWM, etc...)
- Get basic knowledge on the technological aspects of power electronic systems connection
- Get knowledge about reactive power compensation
- Be introduced to FACTS Technology

Engineering analysis:
Graduates will be able to formulate and solve engineering problems related to the control of power systems connected to the grid. Also, the will be able to design and optimise Micro Grids.

Investigations:
Graduates will be able to evaluate the requirements to implement Micro Grids.

Transferable skills:
Graduates will be able to work effectively as professionals and as team members to solve technical problems related to the integration of RE in electric grids. Also, graduates will demonstrate their abilities to communicate effectively in multinational teams.

1. Control of AC/DC drives

- Necessity of power electronics: solar and wind generation, storage, dip and reactive power compensation, DC transport...
- Modelling and simulation of power electronics systems
- Conversion DC/DC (Solar): topology, operation and current control
- Vectorial modelling of three phase systems
- Control of permanent magnets wind turbines
- Conversion DC/AC three phase
- Control of active and reactive power of three phase systems connected to grid
- Dip and interruptions compensation: DVR
- Characterization techniques: harmonics, THD, power factor...
- Overview of other power systems

2. Active network devices and control

- Control system for small wind turbines
- Power inverter design
- Microgrids
- Theory and operation principles of FACTS
- FACTS implementation and technology (Series / Shunt compensation)
- Applications and simulation of power electronics systems using PSCAD/EMTDC
- Modelling of thyristor-based static Var compensator
- Modelling of GTO-Based STATCOM -Modelling of VSC-Based HVD link
- Modelling and performance of SSCC in wind energy application

Reader's advisory
