**Contact person**

- Meinhard Simon
- Alle hier genannten

**Entry requirements**

For the practical course lecture: Methods in Aquatic Microbial Ecology

**Skills to be acquired in this module**

- Analyze bacterial substrates at ambient concentrations such as dissolved amino acids and carbohydrates by high performance liquid chromatography (HPLC), organic carbon by TOC and POC/PON analyser and the composition of the pool of dissolved organic matter by Fourier-Transform Ion Cyclotron Resonance Mass spectrometry (FT-ICR-MS).
- Determine bacterial cell numbers by flow cytometry and epifluorescence microscopy and to analyse these data by image analysis.
- Extract bacterial DNA from water and sediment samples.
- to amplify bacterial genes by specific primers and PCR.
- Assess bacterial communities by culture-independent methods such as denaturing gradient gel electrophoresis.
- present and discuss scientific results
- write a scientific protocol
- The students gain competences in:
  - Understanding how to analyse dissolved substrates of heterotrophic aquatic bacterial communities by state of the art approaches.
  - How to assess the abundance of aquatic bacterial communities by state of the art approaches.
  - Analyzing the composition of bacterial communities by PCR-based culture-independent approaches.

**Module contents**

Methods in Aquatic Microbial Ecology: The course starts with a lecture introducing basic issues of aquatic microbial ecology with an emphasis on methodological aspects. This lecture is completed before the practical work starts. During the practical course of a block of two weeks the participants carry out analyses and experiments on:

- determining the concentration of dissolved organic substrates (amino acids, carbohydrates, dissolved and particulate organic carbon),
- the abundance of bacterial communities in aquatic systems
- The composition of bacterial communities in environmental samples by denaturing gradient gel electrophoresis (DGGE) of 16S rRNA targeted gene fragments.

The main emphasis is on analyses and approaches of bacterial communities in the water column.
